Mathematical Thinking And Writing:

Mathematical Thinking and Writing Randall Maddox, 2001-07-24 The ability to construct proofs is one of the most challenging aspects of the world of mathematics. It is essentially the defining moment for those testing the waters in a mathematical career. Instead of being submerged to the point of drowning, readers of *Mathematical Thinking and Writing* are given guidance and support while learning the language of proof construction and critical analysis. Randall Maddox guides the reader with a warm conversational style through the task of gaining a thorough understanding of the proof process and encourages inexperienced mathematicians to step up and learn how to think like a mathematician. A student's skills in critical analysis will develop and become more polished than previously conceived. Most significantly, Dr. Maddox has the unique approach of using analogy within his book to clarify abstract ideas and clearly demonstrate methods of mathematical precision.

A Transition to Abstract Mathematics Randall Maddox, 2008-10-13 Constructing concise and correct proofs is one of the most challenging aspects of learning to work with advanced mathematics. Meeting this challenge is a defining moment for those considering a career in mathematics or related fields. *A Transition to Abstract Mathematics* teaches readers to construct proofs and communicate with the precision necessary for working with abstraction. It is based on two premises: composing clear and accurate mathematical arguments is critical in abstract mathematics and that this skill requires development and support. Abstraction is the destination, not the starting point. Maddox methodically builds toward a thorough understanding of the proof process, demonstrating and encouraging mathematical thinking along the way. Skillful use of analogy clarifies abstract ideas. Clearly presented methods of mathematical precision provide an understanding of the nature of mathematics and its defining structure. After mastering the art of the proof process, the reader may pursue two independent paths. The latter parts are purposefully designed to rest on the foundation of the first and climb quickly into analysis or algebra. Maddox addresses fundamental principles in these two areas so that readers can apply their mathematical thinking and writing skills to these new concepts. From this exposure, readers experience the beauty of the mathematical landscape and further develop their ability to work with abstract ideas. Covers the full range of techniques used in proofs, including contrapositive induction and proof by contradiction. Explains identification of techniques and how they are applied in the specific problem. Illustrates how to read written proofs with many step-by-step examples. Includes 20% more exercises than the first edition that are integrated into the material instead of end of chapter.

through math concepts *Assisting Students Develop Their Mathematical Thinking Process Through Writing* Carla S. Hillard, 2006 ABSTRACT This qualitative action research study documents the observed and reported experiences of nineteen third grade students and their teacher as they explored how to facilitate mathematical thinking process through written expression The author shares the NCTM s 2000 philosophy that indicates when students gain insight into their thinking they are more effectively able to connect different mathematical strategies to a variety of situations All the participants received instruction on specific math communication strategies throughout the study within their regular education classroom in a suburban elementary school The study examines how the students utilized the modeled strategies in explaining their mathematical thinking process as they progressed through the different math communication levels The study focuses on the scaffolding methods that were implemented in instructing each of the students at his her developmental level The data suggests that the teacher needs to scaffold instruction not only in reference to the student s ability within the specific communication level but also in connection with his her understanding of the specific math concept that he she is being asked to explain In addition the study advocates the need for students to have the opportunity to naturally progress through the distinct communication stages in order to be more successful in independently explicating complex math topics at a later phase Finally the researcher ponders what additional strategies she can implement in assisting her students develop their mathematical thinking process She also questions what supplementary scaffolding methods she would need to employ in working with students who require specialized instruction and or ESL students in communicating their mathematical thinking process
