Mathematical Methods For System Theory:

Mathematical Methods For System Theory F Gentili,Laura Menini, Antonio Tornambe, Luca Zaccarian, 1998-07-31 This book covers selected topics in geometry algebra calculus and probability theory It contains the basic mathematical notions required by a first course in system theory for engineering and applied mathematics students It is the first book to provide a self contained and precise account of all the major mathematical methods and concepts relevant to the study of system theory

On Systems Analysis David Berlinski, 1976 Monograph on theory of systems analysis and the limitations of mathematical analysis discusses general systems theory cybernetics information theory and dynamic systems in the social sciences Diagrams

Three Decades of Mathematical System Theory Hendrik Nijmeijer, Johannes M Schumacher, 2014-01-15 The field of modern mathematical system theory has its origins in the work of R E Kalman in the late fifties It came to a rapid development in the early sixties and has seen a continuing and still growing stream of contributions in the years that followed Today it stands as a well established discipline The volume Three Decades of Mathematical System Theory surveys the developments in this field by presenting 21 articles covering the broad area of system and control theory All articles have been written by well known authors who were invited to give their personal expert view on a particular direction of research Together the contributions in this volume review the wide range of mathematical methods that are being applied in modern system and control theory The mathematical fields that are involved included differential and algebraic geometry linear and commutative algebra and functional and stochastic analysis

System Theory -- A Modern Approach, Volume 1 Henri Bourlès, 2024-07-03 The theory of dynamic systems is addressed in this book in accordance with the modern approach heir to algebraic analysis which has been implemented since the last decade of the 20th century After a reminder of the evolution of the representation of systems based on transfer functions or matrices the duality of controllability and observability is revisited and new results are produced concerning time varying discrete time systems To complete and improve the existing analyses the poles and zeros of linear systems and their interconnections are presented in a new way as well as the problem of systems governed by functional differential equations of retarded or neutral type and their stabilization This book also proposes known and original mathematical complements

Mathematical System Theory Athanasios C. Antoulas, 2013-04-17 Over the past three decades R E Kalman has been one of the most influential personalities in system and control theory His ideas have been instrumental in a variety of areas This is a Festschrift honoring his 60th birthday It contains contributions from leading researchers in the field giving an account of the profound influence of his ideas in a number of areas of active research in system and control theory For example since their introduction by Kalman in the early 60 s the concepts of controllability and observability of dynamical systems with inputs have been the corner stone of the great majority of investigations in the field

Marinus Kaashoek, A.C. Ran, J.H. van Schuppen, 1990 This volume is the first of the three volume publication containing the proceedings of the 1989 International Symposium on the Mathematical Theory of Networks and Systems MTNS 89 which was held in Amsterdam The Netherlands June 19 23 1989 The International Symposia MTNS focus attention on problems from system and control theory circuit theory and signal processing which in general require application of sophisticated mathematical tools such as from function and operator theory linear algebra and matrix theory differential and algebraic geometry The interaction between advanced mathematical methods and practical engineering problems of circuits systems and control which is typical for MTNS turns out to be most effective and is as these proceedings show a continuing source of exciting advances The first volume contains invited papers and a large selection of other symposium presentations on the general theory of deterministic and stochastic systems with an emphasis on realization and modelling A wide variety of recent results on approximate realization and system identification stochastic dynamical systems discrete event systems o systems singular systems and nonstandard models IS presented Preface vi Also a few papers on applications in hydrology and hydraulics are included The titles of the two other volumes are Robust Control of Linear Sys tems and Nonlinear Control volume 2 and Signal Processing Scatter ing and Operator Theory and Numerical Methods volume 3 The Editors are most grateful to the about 300 reviewers for their help in the refereeing process The Editors thank Ms G Bijleveld and Ms

General Systems Theory: Mathematical Foundations, 1975-03-21 In this book we study theoretical and practical aspects of computing methods for mathematical modelling of nonlinear systems A number of computing techniques are considered such as methods of operator approximation with any given accuracy operator interpolation techniques including a non Lagrange interpolation methods of system representation subject to constraints associated with concepts of causality memory and stationarity methods of system representation with an accuracy that is the best within a given class of models methods of covariance matrix estimation methods for low rank matrix approximations hybrid methods based on a combination of iterative procedures and best operator approximation andmethods for information compression and filtering under condition that a filter model should satisfy restrictions associated with causality and different types of memory As a result the book represents a blend of new methods in general computational analysis and specific but also generic techniques for study of systems theory ant its particularbranches such as optimal filtering and information compression Best operator approximation Non Lagrange interpolation Generic Karhunen Loeve transform Generalised low rank matrix approximation Optimal data compression Optimal nonlinear filtering *Advanced Topics in System and Signal Theory* Volker Pohl, Holger Boche, 2009-10-03 The requirement of causality in system theory is inevitably accompanied by the appearance of certain mathematical operations namely the Riesz proj tion theHilberttransform andthespectralfactorizationmapping A classical example illustrating this is the determination of the so called Wiener lter the linear minimum means square error estimation lter for stationary stochastic sequences 88 If the lter is not required to be causal the transfer function of the Wiener lter is simply

given by H where $xy \propto x \propto x$ and are certain given functions. However if one requires that the xy timation lter is causal the transfer function of the optimal lter is given by $1 - xy H P \propto x \propto x$. Here H and P represent the so called spectral factors of x and x . $x P$ is the so called Riesz projection. Thus compared to the non causal lter two additional operations are necessary for the determination of the causal lter namely the spectral factorization mapping and $x \propto x \propto x$ the Riesz projection P .
