**Mathematical Models in biological discovery**, 1975 *Mathematical Models in Biological Discovery* Daniel L. Dynamics of Mathematical Models in Biology Alessandra Rogato, Valeria Zazzu, Mario Guarracino, 2016-11-03 This volume focuses on contributions from both the mathematics and life science community surrounding the concepts of time and dynamicity of nature two significant elements which are often overlooked in modeling process to avoid exponential computations The book is divided into three distinct parts dynamics of genomes and genetic variation dynamics of motifs and dynamics of biological networks Chapters included in dynamics of genomes and genetic variation analyze the molecular mechanisms and evolutionary processes that shape the structure and function of genomes and those that govern genome dynamics The dynamics of motifs portion of the volume provides an overview of current methods for motif searching in DNA RNA and proteins a key process to discover emergent properties of cells tissues and organisms The part devoted to the dynamics of biological networks covers networks aptly discusses networks in complex biological functions and activities that interpret processes in cells Moreover chapters in this section examine several mathematical models and algorithms available for integration analysis and characterization Once life scientists began to produce experimental data at an unprecedented pace it became clear that mathematical models were necessary to interpret data to structure information with the aim to unveil biological mechanisms discover results and make predictions The second annual Bringing Maths to Life workshop held in Naples Italy October 2015 enabled a bi directional flow of ideas from and international group of mathematicians and biologists The venue allowed mathematicians to introduce novel algorithms methods and software that may be useful to model aspects of life science and life scientists posed new challenges for mathematicians **Math and Bio 2010** Lynn Arthur Steen, 2005 Math and bio 2010 grew out of Meeting the Challenges Education across the Biological Mathematical and Computer Sciences a joint project of the Mathematical Association of America MAA the National Science Foundation Division of Undergraduate Education NSF DUE the National Institute of General Medical Sciences NIGMS the American Association for the Advancement of Science AAAS and the American Society for Microbiology ASM Foreword p vi Stochastic Methods in Biology Motoo Kimura, Gopinath Kallianpur, Takeyuki Hida, 2013-03-13 The use of probabilistic methods in the biological sciences has been so well established by now that mathematical biology is regarded by many as a distinct discipline with its own repertoire of techniques The purpose of the Workshop on stochastic methods in biology held at Nagoya University during the week of July 8-12 1985 was to enable biologists and probabilists from Japan and the U S to discuss the latest developments in their respective fields and to exchange ideas on the applicability of the more recent developments in stochastic process theory to problems in biology Eighteen papers were presented at the Workshop and have been grouped

under the following headings I Population genetics five papers II Measure valued diffusion processes related to population genetics three papers III Neurophysiology two papers IV Fluctuation in living cells two papers V Mathematical methods related to other problems in biology epidemiology population dynamics etc six papers An important feature of the Workshop and one of the reasons for organizing it has been the fact that the theory of stochastic differential equations SDE s has found a rich source of new problems in the fields of population genetics and neuro biology This is especially so for the relatively new and growing area of infinite dimensional i e measure valued or distribution valued SDE s The papers in II and III and some of the papers in the remaining categories represent these areas

Mathematical Modelling and Computers in Endocrinology Rosalind McIntosh, 2012-12-06 The building of conceptual models is an inherent part of our interaction with the world and the foundation of scientific investigation Scientists often perform the processes of modelling subconsciously unaware of the scope and significance of this activity and the techniques available to assist in the description and testing of their ideas Mathematics has three important contributions to make in biological modelling 1 it provides unambiguous languages for expressing relationships at both qualitative and quantitative levels of observation 2 it allows effective analysis and prediction of model behaviour and can thereby organize experimental effort productively 3 it offers rigorous methods of testing hypotheses by comparing models with experimental data by providing a means of objectively excluding unsuitable concepts the development of ideas is given a sound experimental basis Many modern mathematical techniques can be exploited only with the aid of computers These machines not only provide increased speed and accuracy in determining the consequences of model assumptions but also greatly extend the range of problems which can be explored The impact of computers in the biological sciences has been widespread and revolutionary and will continue to be so

**Intrinsic Geometry of Biological Surface Growth** Philip H. Todd, 1986-05 1 1 General Introduction The work which comprises this essay formed part of a multidisciplinary project investigating the folding of the developing cerebral cortex in the ferret The project as a whole combined a study at the histological level of the cytoarchitectural development concomitant with folding and a mathematical study of folding viewed from the perspective of differential geometry We here concentrate on the differential geometry of brain folding Histological results which have some significance to the geometry of the cortex are referred to but are not discussed in any depth As with any truly multidisciplinary work this essay has objectives which lie in each of its constituent disciplines From a neuroanatomical point of view the work explores the use of the surface geometry of the developing cortex as a parameter for the underlying growth process Geometrical parameters of particular interest and theoretical importance are surface curvatures Our experimental portion reports the measurement of the surface curvature of the ferret brain during the early stages of folding The use of surface curvatures and other parameters of differential geometry in the formulation of theoretical models of cortical folding is discussed

*Revue Roumaine de Mathématiques Pures Et Appliquées*, 1981 *Temporal-Pattern Learning in Neural Models* Carme Torras i Genis, 1985-12 While the ability of animals to learn rhythms is an unquestionable fact the underlying neurophysiological mechanisms are still no more than conjectures This monograph explores the requirements of such mechanisms reviews those previously proposed and postulates a new one based on a direct electric coding of stimulation frequencies Experimental support for the option taken is provided both at the single neuron and neural network levels More specifically the material presented divides naturally into four parts a description of the experimental and theoretical framework where this work becomes meaningful Chapter 2 a detailed specification of the pacemaker neuron model proposed together with its validation through simulation Chapter 3 an analytic study of the behavior of this model when submitted to rhythmic stimulation Chapter 4 and a description of the neural network model proposed for learning together with an analysis of the simulation results obtained when varying several factors related to the connectivity the intraneuronal parameters the initial state and the stimulation conditions Chapter 5 This work was initiated at the Computer and Information Science Department of the University of Massachusetts Amherst and completed at the Institut de Ciències de l'Computador i de la Comunicació of the Universitat Politècnica de Catalunya Barcelona Computers at the latter place have adopted Catalan as their mother tongue and thus some computer made figures in this monograph specially those in Chapter 5 appear labeled in that tongue *Time Lags in Biological Models* N. MacDonald, 1978-11-05 In many biological models it is necessary to allow the rates of change of the variables to depend on the past history rather than only the current values of the variables The models may require discrete lags with the use of delay differential equations or distributed lags with the use of integro differential equations In these lecture notes I discuss the reasons for including lags especially distributed lags in biological models These reasons may be inherent in the system studied or may be the result of simplifying assumptions made in the model used I examine some of the techniques available for studying the solution of the equations A large proportion of the material presented relates to a special method that can be applied to a particular class of distributed lags This method uses an extended set of ordinary differential equations I examine the local stability of equilibrium points and the existence and frequency of periodic solutions I discuss the qualitative effects of lags and how these differ according to the choice of discrete or distributed lag The models studied are drawn from the population dynamics of single species logistic growth the chemostat and of interacting pairs of species predation mutualism from cell population dynamics haemopoiesis and from biochemical kinetics the Goodwin oscillator The last chapter is devoted to a population model employing difference equations

All these models include non linear terms      Cell Kinetic Modelling and the Chemotherapy of Cancer Helmut Knolle,1988  
 This monograph establishes a necessary link between experimental cancer research and mathematical modelling of cell population and presents a new approach to the old problem of building a rational basis for the design of radio and chemotherapy of cancer Rather than embark straightaway on model building the author gives priority to the determination of action parameters of cytotoxic drugs A survey of autoradiographic experiments and evaluation methods in cell kinetics is given and classical formulae in this field are improved or generalized The cell cycle retarding effect of certain drugs which in the past raised some controversy is described in a concise quantitative frame work Finally a mathematical model of cell populations under treatment is tested against data from experiments with cell cycle phase specific drugs and is applied to the problem of choosing optimal time schedules of chemotherapy The book will serve as a guide to mathematical cell kinetics for biologists as well as an introduction to the biomedical environment of the field for mathematicians A knowledge of matrix algebra calculus and ordinary differential equations is expected of the reader but is not essential for using the results in the design and evaluation of cell kinetic experiments      **Fundamentals of Ordinary Differential Equations** Mohit
