Mathematics Of Adaptive Control Processes:

Adaptive Control Processes Richard E. Bellman, 2015-12-08 The aim of this work is to present a unified approach to the modern field of control theory and to provide a technique for making problems involving deterministic stochastic and adaptive processes of both linear and nonlinear type amenable to machine solution Mr Bellman has used the theory of dynamic programming to formulate analyze and prepare these processes for numerical treatment by digital computers The unique concept of the book is that of a single problem stretching from recognition and formulation to analytic treatment and computational solution Due to the emphasis upon ideas and concepts this book is equally suited for the pure and applied mathematician and for control engineers in all fields Originally published in 1961 The Princeton Legacy Library uses the latest print on demand technology to again make available previously out of print books from the distinguished backlist of Princeton University Press These editions preserve the original texts of these important books while presenting them in durable paperback and hardcover editions The goal of the Princeton Legacy Library is to vastly increase access to the rich scholarly heritage found in the thousands of books published by Princeton University Press since its founding in 1905

Adaptive Markov Control Processes Onesimo Hernandez-Lerma, 2012-12-06 This book is concerned with a class of discrete time stochastic control processes known as controlled Markov processes CMP s also known as Markov decision processes or Markov dynamic programs Starting in the mid 1950s with Richard Bellman many contributions to CMP s have been made and applications to engineering statistics and operations research among other areas have also been developed The purpose of this book is to present some recent developments on the theory of adaptive CMP s i e CMP s that depend on unknown parameters Thus at each decision time the controller or decision maker must estimate the true parameter values and then adapt the control actions to the estimated values We do not intend to describe all aspects of stochastic adaptive control rather the selection of material reflects our own research interests The prerequisite for this book is a knowledge of real analysis and probability theory at the level of say Ash 1972 or Royden 1968 but no previous knowledge of control or decision processes is required The presentation on the other hand is meant to be self contained in the sense that

whenever a result from analysis or probability is used it is usually stated in full and references are supplied for further discussion if necessary. Several appendices are provided for this purpose. The material is divided into six chapters. Chapter 1 contains the basic definitions about the stochastic control problems we are interested in; a brief description of some applications is also provided.

On Adaptive Control Processes Richard Bellman, Robert E. Kalaba, 1959

Mathematical Theory of Adaptive Control Vladimir Grigor'evich Sragovich, 2006

The theory of adaptive control is concerned with construction of strategies so that the controlled system behaves in a desirable way without assuming the complete knowledge of the system. The models considered in this comprehensive book are of Markovian type. Both partial observation and partial information cases are analyzed. While the book focuses on discrete time models, continuous time ones are considered in the final chapter. The book provides a novel perspective by summarizing results on adaptive control obtained in the Soviet Union which are not well known in the West. Comments on the interplay between the Russian and Western methods are also included.

Optimal Adaptive Control Systems by David S. Sworder, 1966-01-01

In this book we study theoretical and practical aspects of computing methods for mathematical modelling of nonlinear systems. A number of computing techniques are considered such as methods of operator approximation with any given accuracy, operator interpolation techniques including a non-Lagrange interpolation method of system representation subject to constraints associated with concepts of causality, memory and stationarity, methods of system representation with an accuracy that is the best within a given class of models, methods of covariance matrix estimation, methods for low rank matrix approximations, hybrid methods based on a combination of iterative procedures and best operator approximation, and methods for information compression and filtering under condition that a filter model should satisfy restrictions associated with causality and different types of memory. As a result, the book represents a blend of new methods in general computational analysis and specific but also generic techniques for study of systems theory and its particular branches such as optimal filtering and information compression.

Best operator approximation
Non-Lagrange interpolation
Generic Karhunen-Loève transform
Generalised low rank matrix approximation
Optimal data compression
Optimal nonlinear filtering

Digital Control Systems Rolf Isermann, 2012-12-06

The great advances made in large scale integration of semiconductors and the resulting cost effective digital processors and data

storage devices determine the present development of automation The application of digital techniques to process automation started in about 1960 when the first process computer was installed From about 1970 process computers with cathodic ray tube display have become standard equipment for larger automation systems Until about 1980 the annual increase of process computers was about 20 to 30% The cost of hardware has already then shown a tendency to decrease whereas the relative cost of user software has tended to increase Because of the high total cost the first phase of digital process automation is characterized by the centralization of many functions in a single though sometimes in several process computer Application was mainly restricted to medium and large processes Because of the far reaching consequences of a breakdown in the central computer parallel standby computers or parallel back up systems had to be provided This meant a substantial increase in cost The tendency to overload the capacity and software problems caused further difficulties In 1971 the first microprocessors were marketed which together with large scale integrated semiconductor memory units and input output modules can be assembled into cost effective microcomputers These microcomputers differ from process computers in fewer but higher integrated modules and in the adaptability of their hardware and software to specialized less comprehensive tasks
