Moments in Mathematics Henry J. Landau, American Mathematical Society, 1987 Function theory spectral decomposition of operators probability approximation electrical and mechanical inverse problems prediction of stochastic processes the design of algorithms for signal processing VLSI chips these are among a host of important theoretical and applied topics illuminated by the classical moment problem To survey some of these ramifications and the research which derives from them the AMS sponsored the Short Course Moments in Mathematics at the Joint Mathematics Meetings held in San Antonio Texas in January 1987 This volume contains the six lectures presented during that course The papers are likely to find a wide audience for they are expository but nevertheless lead the reader to topics of current research In his paper Henry J Landau sketches the main ideas of past work related to the moment problem by such mathematicians as Caratheodory Herglotz Schur Riesz and Krein and describes the way the moment problem has interconnected so many diverse areas of research J H B Kemperman examines the moment problem from a geometric viewpoint which involves a certain natural duality method and leads to interesting applications in linear programming measure theory and dilations Donald Sarason first provides a brief review of the theory of unbounded self adjoint operators then goes on to sketch the operator theoretic treatment of the Hamburger problem and to discuss Hankel operators the Adamjan Arov Krein approach and the theory of unitary dilations Exploring the interplay of trigonometric moment problems and signal processing Thomas Kailath describes the role of Szego polynomials in linear predictive coding methods parallel implementation one dimensional inverse scattering problems and the Toeplitz moment matrices Christian Berg contrasts the multi dimensional moment problem with the one dimensional theory and shows how the theory of the moment problem may be viewed as part of harmonic analysis on semigroups Starting from a historical survey of the use of moments in probability and statistics Persi Diaconis illustrates the continuing vitality of these methods in a variety of recent novel problems drawn from such areas as Wiener Ito integrals random graphs and matrices Gibbs ensembles cumulants and self similar processes projections of high dimensional data and empirical estimation [Encyclopaedia of Mathematics \(set\)](#) Michiel Hazewinkel, 1994-02-28 The Encyclopaedia of Mathematics is the most up to date authoritative and comprehensive English language work of reference in mathematics which exists today With over 7 000 articles from A integral to Zygmund Class of Functions supplemented with a wealth of complementary information and an index volume providing thorough cross referencing of entries of related interest the Encyclopaedia of Mathematics offers an immediate source of reference to mathematical definitions concepts explanations surveys examples terminology and methods The depth and breadth of content and the straightforward careful presentation of the information with the emphasis on accessibility makes the Encyclopaedia of Mathematics an immensely useful tool for all mathematicians and other scientists who use or are confronted by mathematics in their work The Encyclopaedia of Mathematics provides without doubt a reference source of mathematical knowledge which is unsurpassed in value and

Flat Extensions of Positive Moment Matrices: Recursively Generated Relations Raúl E. Curto, Lawrence A. Fialkow,1998 In this book the authors develop new computational tests for existence and uniqueness of representing measures μ in the Truncated Complex Moment Problem $\gamma_{ij} = \int z^i \bar{z}^j d\mu$ $0 \leq i, j \leq 2n$ Conditions for the existence of finitely atomic representing measures are expressed in terms of positivity and extension properties of the moment matrix $M_n(\gamma)$ associated with $\gamma \equiv \gamma_{2n}$ $\gamma_{00} \dots \gamma_{0,2n} \dots \gamma_{2n,0} \gamma_{2n,0}$ This study includes new conditions for flat i e rank preserving extensions M_{n+1} of M_n $g \geq 0$ each such extension corresponds to a distinct rank M_n atomic representing measure and each such measure is minimal among representing measures in terms of the cardinality of its support For a natural class of moment matrices satisfying the tests of recursive generation recursive consistency and normal consistency the existence problem for minimal representing measures is reduced to the solubility of small systems of multivariable algebraic equations In a variety of applications including cases of the quartic moment problem $n=2$ the text includes explicit constructions of minimal representing measures via the theory of flat extensions Additional computational texts are used to prove non existence of representing measures or the non existence of minimal representing measures These tests are used to illustrate in very concrete terms new phenomena associated with higher dimensional moment problems that do not appear in the classical one dimensional moment problem *The Messenger of Mathematics* ,1882 **Oxford, Cambridge, and Dublin Messenger of Mathematics** ,1875 **A Treatise on the Mathematical Theory of Elasticity** Augustus Edward Hough Love,1927 **Mathematical Statistics** Henry Lewis Rietz,1927 **The Quarterly Journal of Pure and Applied Mathematics** James Joseph Sylvester,James Whitbread Lee Glaisher,1903 **The**
