Mathematical Statistics And Data Analysis

John A. Rice

Mathematical Statistics And Data Analysis:

Mathematical Statistics and Data Analysis John A. Rice, 2007 This is the first text in a generation to re-examine the purpose of the mathematical statistics course. The book's approach interweaves traditional topics with data analysis and reflects the use of the computer with close ties to the practice of statistics. The author stresses analysis of data, examines real problems with real data, and motivates the theory. The book's descriptive statistics, graphical displays, and realistic applications stand in strong contrast to traditional texts that are set in abstract settings. Probability, Statistics, and Data Analysis

Oscar Kempthorne, Leroy Folks, 1971 General background, the nature of real populations, Calculus of probability, Some commonly occurring mathematical distributions, Distributions of functions of random variables, Distribution of sample statistics, Stochastic processes, General outline of data interpretation problems, Goodness of fit of a completely specified model, Parametric models and likelihood theory, Statistical tests. *Bndl: Mathematical Statistics & Data Analysis W/CD*, 2009-06

ACP MATHEMATICAL STATISTICS and DATA ANALYSIS Brooks/Cole, 2016-09-08 *Foundations of Statistics for Data Scientists* Alan Agresti, Maria Kateri, 2021-11-29 *Foundations of Statistics for Data Scientists With R and Python* is designed as a textbook for a one or two term introduction to mathematical statistics for students training to become data scientists. It is an in-depth presentation of the topics in statistical science with which any data scientist should be familiar, including probability distributions, descriptive and inferential statistical methods, and linear modeling. The book assumes knowledge of basic calculus so the presentation can focus on why it works as well as how to do it. Compared to traditional mathematical statistics textbooks, however, the book has less emphasis on probability theory and more emphasis on using software to implement statistical methods and to conduct simulations to illustrate key concepts. All statistical analyses in the book use R software, with an appendix showing the same analyses with Python. Key Features: Shows the elements of statistical science that are important for students who plan to become data scientists; Includes Bayesian and regularized fitting of models, e.g., showing an example using the lasso classification and clustering and implementing methods with modern software R and Python; Contains nearly 500 exercises. The book also introduces modern topics that do not normally appear in mathematical statistics texts but are highly relevant for data scientists, such as Bayesian inference, generalized linear models for non-normal responses, e.g., logistic regression and Poisson loglinear models, and regularized model fitting. The nearly 500 exercises are grouped into Data Analysis and Applications and Methods and Concepts. Appendices introduce R and Python and contain solutions for odd-numbered exercises. The book's website <http://stat4ds.rwth-aachen.de> has expanded R, Python, and Matlab appendices and all data sets from the examples and exercises.
