Mathematics Tomorrow:

Mathematics Tomorrow L.A. Steen, 2012-12-06 Mathematics today is approaching a state of crisis. As the demands of science and society for mathematical literacy increase, the percentage of American college students intending to major in mathematics plummets and achievement scores of entering college students continue to decline. As research in core mathematics reaches unprecedented heights of power and sophistication, the growth of diverse applied specialities threatens to fragment mathematics into distinct and frequently hostile mathematical sciences. These crises in mathematics presage difficulties for science and engineering and alarms are beginning to sound in the scientific and even in the political communities. Citing a trend towards virtual scientific and technological illiteracy and a shrinking of our national commitment to excellence in science, mathematics and technology, a recent study conducted for the President by the U.S. National Science Foundation and Department of Education warns of serious impending shortcomings in public understanding of science. Today people in a wide range of non-scientific professions must have a greater understanding of technology than at any time in our history. Yet our educational system does not now provide such understanding. The study goes on to conclude that present trends pose great risk of manpower shortages in the mathematical and engineering sciences. The pool from which our future scientific and engineering personnel can be drawn is in danger of becoming smaller even as the need for such personnel is increasing. It is time to take a serious look at mathematics tomorrow.

[Tomorrow's High School](#) Gene Bottoms, 2022-04-11 How do some high schools produce graduates that consistently achieve at high levels? Would you believe there's a set of proven strategies that could help you deliver similar impressive results and better prepare students for the world after high school? High schools in the United States face a startling reality: many graduates are unprepared for success in postsecondary studies or for high-demand, well-paying jobs in a rapidly changing economy. Although this situation is alarming, the high schools that have embraced new ways of learning show us what is possible. Drawing from his experience with the High Schools That Work initiative, Gene Bottoms offers educators a path forward by urging them to pursue bold goals and outlining bold actions for achieving those goals. His vision is clear: replace the traditional model of secondary education with one that engages students in a rigorous curriculum that combines a solid academic core with intellectually demanding career pathway courses. The notion that nearly all students can achieve at high levels is borne out by numerous examples of high schools, including those with traditionally underperforming student populations, that have used key strategies to help all students realize their potential. Bottoms explains the root causes of the current shortcomings in high school education and then specifies critical components of successful transformation. Shared leadership, Powerful assignments, especially in math literacy and career technical education, planned and executed by academic and career pathway teachers working together, Strengthened connections between middle school and high school, A redesigned senior year, and Comprehensive counseling and advisory programs. Provocative and persuasive in its sense of urgency, Tomorrow's

Mathematics for Tomorrow's Young Children C.S. Mansfield,N.A. Pateman,N. Bednarz,2013-03-09 Social constructivism is just one view of learning that places emphasis on the social aspects of learning Other theoretical positions such as activity theory also emphasise the importance of social interactions Along with social constructivism Vygotsky's writings on children's learning have recently also undergone close scrutiny and researchers are attempting a synthesis of aspects of Vygotskian theory and social constructivism This re-examination of Vygotsky's work is taking place in many other subject fields besides mathematics such as language learning by young children It is interesting to speculate why Vygotsky's writings have appealed to so many researchers in different cultures and decades later than his own times Given the recent increased emphasis on the social nature of learning and on the interactions between student teacher and context factors a finer grained analysis of the nature of different theories of learning now seems to be critical and it was considered that different views of students learning of mathematics needed to be acknowledged in the discussions of the Working Group
