## **Measles Virus:**

**How Pathogenic Viruses Work** Lauren Sompayrac,2002 A clever accessible overview that uses a survey of 12 of the most common viral infections to teach the fundamental principles of human virology     **Measles Virus** Volker ter Meulen,Martin F. Bach,2012-12-06 Measles also called the greatest killer of children in history still annually affects about 50 million individuals and causes close to a million deaths primarily in developing countries Before the advent of measles vaccine some 30 years ago these figures were roughly three times higher Attenuated measles virus MV strains all quite closely related to the original Edmonston isolate have a very good record as a safe and highly efficacious vaccine and have brought down the measles toll in industrialized countries to almost negligible levels However recent outbreaks in the USA and Europe have again brought the measles problem to public attention Sadly enough these outbreaks were more instrumental in inducing activities to drastically reduce and hopefully finally eradicate measles than were the ten thousand times higher number of victims in developing countries To reach this goal as detailed in this volume apparently it is not enough to of the existing vaccine as was the rigorously enforce use case with smallpox eradication the intricacies of measles disease phenomena in particular the generalized immune suppression which favors secondary infections require more basic knowledge of the virus host interactions and probably the development of new vaccines for special applications such as first immunizations of very young infants in developing countries     *Molecular Detection of Human Viral Pathogens* Dongyou Liu,2016-04-19 Despite being recognized and fought against over countless centuries human viral pathogens continue to cause major public health problems worldwide killing millions of people and costing billions of dollars in medical care and lost productivity each year With contributions from specialists in their respective areas of viral pathogen research Mol

**Viral Infections of Humans** Richard A. Kaslow,Lawrence R. Stanberry,James W. Le Duc,2014-09-27 Striking changes have occurred in the world since the publication of the last edition of *Viral Infections of Humans* The global population is rapidly approaching 8 billion climate change is leading to the introduction of new hosts vectors and virus diseases heretofore never seen in many parts of the world technological advances have revolutionized the ability to recognize and characterize viruses new and old vaccines are altering the epidemiological landscape of the diseases they target in some cases raising the hope of their eradication and remarkably powerful computational tools are enabling not only detection of outbreaks of disease much sooner than in the past but also through complex mathematical modeling more accurate prediction of their potential impact The new Fifth Edition of *Viral Infections of Humans* captures the both the excitement and frustration of the dynamic struggle between humankind and the viruses that continue to cause immense suffering It presents the latest concepts methods and technologies in epidemiology detection investigation modeling and intervention Updated and entirely new chapters by dozens of experts across the field provide analytic summaries of current knowledge of viruses and prions causing acute syndromes chronic illnesses and or malignancies In sum this ambitiously expanded volume offers a uniquely comprehensive perspective

on viruses in humans from agents of classic diseases e g hepatitis measles polio rabies and yellow fever to those with greatest pandemic impact e g influenza and human immunodeficiency virus to those discovered relatively recently e g henipavirus metapneumovirus and norovirus The new Fifth Edition of *Viral Infections of Humans* is an invaluable reference for students fellows and established professionals in the fields of microbiology public health and infectious disease epidemiology medicine and health policy

Receptor usage and pathogenesis in acute and chronic viral infection Yasuko Tsunetsugu-Yokota, Kazutaka Terahara, In the first phase of the viral life cycle the virus enters cells using a specific cell surface receptor Many viruses use multiple receptors some of which are unique to a certain cell type while others are ubiquitous in many cell types Depending on the receptors used the viral cell tropism is determined which may result in the characteristic distribution of virus infected cells tissues Obviously virus entry is not the whole story After the virus enters various cellular proteins interact with it some support virus replication while others inhibit it The intrinsic anti viral cellular machinery differs among cell types thus viral cell tropism based on the receptor usage plays an important role in the pathogenesis For example HIV 1 utilizes one of two co receptors CXCR4 or CCR5 in addition to a major receptor CD4 CCR5 expression is restricted to a certain subset of memory CD4 T cells while CXCR4 expression is rather ubiquitous among CD4 T cells Therefore the latent infection of CCR5 utilizing HIV 1 in resting memory CCR5 T cells would be largely responsible for intermittent virus blimps accompanied by immune activation during chronic HIV infection This may explain why CCR5 utilizing HIV 1 is preferentially isolated in the early phase of HIV 1 infection even when the HIV 1 transmitter carries CXCR4 utilizing HIV 1 in abundance In the case of the measles virus CD150 Signaling Lymphocyte Activation Molecule SLAM is a major receptor while vaccine strains utilize CD46 when CD150 is not available The third possible entry receptor would also be utilized for the infection of lung epithelial cells The impact of these receptor usages *in vivo* on the disease outcome is now under investigation We also know that the distinct use of host cell sugar moieties mediates species tropism in the influenza virus and that a mutant virus breaking the species barrier is highly pathogenic in humans Thanks to the recent development of reverse genetics it is now possible to visualize virus infected cells or even the virus itself by using highly sensitive flow cytometry or microscopy How viral cell tropism determined by the receptor used can affect the disease course of acute and chronic virus infection is an important question to address In this Research Topic we focus on studies connecting virus receptor usage and the pathogenesis of various viruses causing acute or chronic infection

Vaccines for Biodefense and Emerging and Neglected Diseases Alan D.T. Barrett, Lawrence R. Stanberry, 2009-03-05 The last 20 years has seen a rapid increase in infectious diseases particularly those that are termed emerging diseases such as SARS neglected diseases such as malaria and those that are deemed biothreats such as anthrax It is well recognized that the most effective modality for preventing infectious diseases is vaccination This book provides researchers with a better understanding of what is currently known about these diseases including whether there is a vaccine available or under development It also informs readers of

the key issues in development of a vaccine for each disease Provides a comprehensive treatise of the agents that are responsible for emerging and neglected diseases and those that can be used as biothreats Includes the processes such as the vaccine development pathway vaccine manufacturing and regulatory issues that are critical to the generation of these vaccines to the marketplace Each chapter will include a map of the world showing where that particular disease is naturally found

**Measles** Diane E. Griffin,Michael B. A. Oldstone,2008-10-30 Measles virus one of the most contagious of all human viruses has been largely contained by the development and use of a vaccine that was introduced 50 years ago These two volumes were timed to honor the introduction of the vaccine and to record the enormous advancements made in understanding the molecular and cell biology pathogenesis and control of this infectious disease Where vaccine has been effectively delivered endemic measles virus transmission has been eliminated However difficulties in vaccine delivery lack of health care support and objection to vaccination in some communities continue to result in nearly 40 million cases and over 300 000 deaths per year from measles

Viruses and Human Disease Ellen G. Strauss,James H. Strauss,2007-09-21

Completely revised and updated the new edition of this groundbreaking text integrates basic virology with pathophysiological conditions to examine the connection between virology and human disease Most virology textbooks focus on the molecular biology involved without adequate reference to physiology This text focuses on viruses that infect humans domestic animals and vertebrates and is based on extensive course notes from James Strauss virology class at the California Institute of Technology taught for over 30 years Expertly depicting in color the molecular structure and replication of each virus it provides an excellent overview for students and professionals interested in viruses as agents of human disease Includes over 30% new material virtually all of the figures and tables have been redrawn to include the latest information and the text has been extensively rewritten to include the most up to date information Includes a new chapter on emerging and reemerging viral diseases such as avian flu SARS the spread of West Nile virus across America and the continuing spread of Nipah virus in Southeast Asia Further reading sections at the end of each chapter make it easy find key references World maps depicting the current distribution of existing and newly emerging viruses are also incorporated into the text

Measles Virus and Its Biology K. B. Fraser,S J Martin,2013-09-17 Measles Virus and Its Biology deals with the biological and clinical problems of

the viral disease measles This book also describes the behavior of the measles virus in terms of its immunological biochemical or molecular biological aspects The authors review the epidemiology and pathogenesis of measles and discuss how the virus flourishes and mobilizes in the human body through a close association with leukocytes and lymphoid organs Biological characters and genetic markers of the virus can serve to separate different isolates of the measles virus from one another Radioactive labeling techniques have detected six structural proteins associated with the virus a schematic diagram in the book shows the structural components and the biochemical dissection of the virus The authors also discuss that the various immune responses to the virus can be due to variation in the patient rather than virus mutation The authors do not

discount that the physiological behavior of the virus such as its location number or replication can also affect the host This text is suitable for the clinical research workers dealing with immunology infectious diseases cellular chemistry or molecular biology    A System of Bacteriology in Relation to Medicine Medical Research Council (Great Britain),1930
