Williams, A. Toni, J. Middleton, G. Pallotti, 1991-02-28 The first Interfaces Conference was held at Swansea in April 1988 and represented the then state of the art of the science of implant surgery The motivation for the initial venture was a supposed need for a closer interaction and dialogue between the clinician and scientist working in this area As expressed in the

Preface to the first Conference we felt that the interface was represented graphically scientifically and psychologically by the drawings of Edgar Rubins 1915 again widely used in the literature to the present Proceedings The first Conference we believe achieved the aims of the organisers in bringing together scientists and clinicians towards an exchange of ideas by logically pursuing the sequence of events in clinical implant surgery The present Conference in collaboration with our Italian colleagues has also attempted to achieve the same aims by examining the behaviour of implants constructed of a variety of materials in both hard and soft tissue Many contributions in the conference employed the technique of finite element analysis both for design and optimisation purposes particularly in relation to bone remodelling Indeed this particular aspect of the Conference led to much debate and will require a major examination of the many levels of physical chemical and biomechanical interactive behaviour of the implant and its environment All this natural behaviour was presented and discussed but difficulties and failures remain with such procedures and we feel it is only by continuing such meetings that we progress in this difficult area of clinical science     *Residual Strength of Clay and Clay-shales by Rotation Shear Tests* Daniel P. LaGatta,1970 The objectives of this investigation were to develop a rotation shear machine to measure the residual shear strength constant shearing resistance at which material undergoes continuous deformation under a constant state of effective stress of clays and clay shales investigate testing errors and measure residual shear strengths of representative types of highly plastic clays and clay shales In the rotation shear test torque is applied to the bottom of the specimen and two force transducers measure the couple necessary to maintain the upper half of the specimen stationary Disc shaped or annular specimens with thicknesses from 0 1 to 2 5 cm and outside diameters of 7 11 cm can be tested Variations in residual shear strength were investigated for normally consolidated versus overconsolidated specimens for specimens sheared at different rates of peripheral displacement and for specimens prepared by several different remolding procedures Author Modified Abstract
