- **Lerner Index of Monopoly Power:** excess of price over  $MC$  as fraction of price (from eq.1).
- $L = (P - MC)/P$ ;  $0 \leq L \leq 1$ .
- $L = 0$  for PC (when  $P = MC$ ).
- Remember:  $L = -1/E_D$  but now this  $E_D$  is for a specific firm.

## Measuring Market Power:

**Measuring Market Power with Variables Other Than Price** Lynn Hunnicutt, 2002 *Measuring Market Power in U.S. Industry* Matthew David Shapiro, 1987 Non competitive conduct can be assessed by estimating the size of the markup or Lerner index achieved in a market The markup implies a price elasticity of demand faced by the representative firm For a given markup non competitive conduct is greater the more elastic is the market elasticity of demand The ratio of the firm's to the market elasticity is a measure of non competitive conduct that is insensitive to the value of the monopoly To implement this measure both the firm's and the market elasticities of demand must be estimated Hall shows how to estimate the markup and hence the elasticity faced by the firm from the cyclical behavior of productivity To estimate the market elasticity an instrumental variables procedure exploiting a covariance restriction between productivity shocks and demand shocks is used Results for broad sectors of private industry and for non durable manufacturing industries display a wide range of monopoly power
