Segall, 2010-08-23      Mechanical Response of Polymers Alan S. Wineman, K. R. Rajagopal, 2000-06-05 With increasing use of polymers in sophisticated industrial applications it is essential that mechanical engineers have a solid understanding of these compounds This text provides a thorough introduction to polymers from a mechanical engineering perspective treating stresses and deformations in structural components made of polymers The authors discuss the time dependent response of polymers and its implications for mechanical response mechanical response for both time dependent and frequency dependent material properties and the application of the stress strain time relation to determine stresses and deformations in structures With numerous examples and extensive illustrations this book will help advanced undergraduate and graduate students as well as practicing mechanical engineers to make effective use of polymeric materials      Mechanical Behaviour of Engineering Materials Y.M. Haddad, 2001-11-30 This monograph consists of two volumes and provides a unified comprehensive presentation of the important topics pertaining to the understanding and determination of the mechanical behaviour of engineering materials under different regimes of loading The large subject area is separated into eighteen chapters and four appendices all self contained which give a complete picture and allow a thorough understanding of the current status and future direction of individual topics Volume I contains eight chapters and three appendices and concerns itself with the basic concepts pertaining to the entire monograph together with the response behaviour of engineering materials under static and quasi static loading Thus Volume I is dedicated to the introduction the basic concepts and principles of the mechanical response of engineering materials together with the relevant analysis of elastic elastic plastic and viscoelastic behaviour Volume II consists of ten chapters and one appendix and concerns itself with the mechanical behaviour of various classes of materials under dynamic loading together with the effects of local and microstructural phenomena on the response behaviour of the material Volume II also contains selected topics concerning intelligent material systems and pattern recognition and classification methodology for the characterization of material response states The monograph contains a large number of illustrations numerical examples and solved problems The majority of chapters also contain a large number of review problems to challenge the reader The monograph can be used as a textbook in science and engineering for third and fourth undergraduate levels as well as for the graduate levels It is also a definitive reference work for scientists and engineers involved in the production processing and applications of engineering materials as well as for other professionals who are involved in the engineering design process

Grubb, 1979      *Processing and Mechanical Response of Engineering Materials* Judy Schneider, 2007      *Mechanical Response of Composites* Pedro P. Camanho, C. G. Dávila, S. T. Pinho, J. J. C. Remmers, 2008-06-20

The methodology for designing high performance composite structures is still evolving. The complexity of the response of composite materials and the difficulties in predicting the composite material properties from the basic properties of the constituents result in the need for a well planned and exhaustive test program. The recommended practice to mitigate the technological risks associated with advanced composite materials is to substantiate the performance and durability of the design in a sequence of steps known as the Building Block Approach. The Building Block Approach ensures that cost and performance objectives are met by testing greater numbers of smaller less expensive specimens. In this way technology risks are assessed early in the program. In addition the knowledge acquired at a given level of structural complexity is built up before progressing to a level of increased complexity. Achieving substantiation of structural performance by testing alone can be prohibitively expensive because of the number of specimens and components required to characterize all material systems loading scenarios and boundary conditions. Building Block Approach programs can achieve significant cost reductions by seeing a synergy between testing and analysis. The more the development relies on analysis the less expensive it becomes. The use of advanced computational models for the prediction of

the mechanical response of composite structures can replace some of the mechanical tests and can significantly reduce the cost of designing with composites while providing to the engineers the information necessary to achieve an optimized design
