Evolution by Natural Selection

Michaelis Michael, 2015-11-18 A persistent argument among evolutionary biologists and philosophers revolves around the nature of natural selection Evolution by Natural Selection Confidence Evidence and the Gap explores this argument by using a theory of persistence as an intentional foil to examine ways in which similar theories can be misunderstood It discusses Charles Dar Darwinian Populations and Natural Selection Peter Godfrey-Smith, 2009-03-26 In 1859 Darwin described a deceptively simple mechanism that he called natural selection a combination of variation inheritance and reproductive success He argued that this mechanism was the key to explaining the most puzzling features of the natural world The exact nature of the Darwinian process has been controversial ever since Draws on new developments in biology philosophy of science and other fields to give a new analysis and extension of Darwin's idea The central concept used is that of a Darwinian population a collection of things with the capacity to undergo change by natural selection From this starting point new analyses of the role of genes in evolution the application of Darwinian ideas to cultural change and evolutionary transitions that produce complex organisms and societies are developed **On the Origin of Species** Charles Darwin, 2012-03-12 DIV Reasoned and well documented in its arguments this work offers coherent views of natural selection adaptation the struggle for existence survival of the fittest and other concepts that form the foundation of evolutionary theory div

Natural Selection in the Wild John A. Endler, 1986-04-21 Natural selection is an immense and important subject yet there have been few attempts to summarize its effects on natural populations and fewer still which discuss the problems of working with natural selection in the wild These are the purposes of John Endler's book In it he discusses the methods and problems involved in the demonstration and measurement of natural selection presents the critical evidence for its existence and places it in an evolutionary perspective Professor Endler finds that there are a remarkable number of direct demonstrations of selection in a wide variety of animals and plants The distribution of observed magnitudes of selection in natural populations is surprisingly broad and it overlaps extensively the range of values found in artificial selection He argues that the common assumption that selection is usually weak in natural populations is no longer tenable but that natural selection is only one component of the process of evolution natural selection can explain the change of frequencies of variants but not their origins The Inadequacy of "Natural Selection". Herbert Spencer, 1894 **The Origin of Species** Charles

Darwin, 2014-01-18 On the Origin of Species published on 24 November 1859 is a work of scientific literature by Charles Darwin which is considered to be the foundation of evolutionary biology Its full title was On the Origin of Species by Means of Natural Selection or the Preservation of Favoured Races in the Struggle for Life Darwin's book introduced the scientific theory that populations evolve over the course of generations through a process of natural selection It presented a body of evidence that the diversity of life arose by common descent through a branching pattern of evolution Darwin included

evidence that he had gathered on the Beagle expedition in the 1830s and his subsequent findings from research correspondence and experimentation Various evolutionary ideas had already been proposed to explain new findings in biology Ideas about the transmutation of species were controversial as they conflicted with the beliefs that species were unchanging parts of a designed hierarchy and that humans were unique unrelated to other animals The political and theological implications were intensely debated but transmutation was not accepted by the scientific mainstream

Natural Selection Richard G. Delisle, 2021-02-27 This book contests the general view that natural selection constitutes the explanatory core of evolutionary biology It invites the reader to consider an alternative view which favors a more complete and multidimensional interpretation It is common to present the 1930-1960 period as characterized by the rise of the Modern Synthesis an event structured around two main explanatory commitments 1 Gradual evolution is explained by small genetic changes variations oriented by natural selection a process leading to adaptation 2 Evolutionary trends and speciation events are macroevolutionary phenomena that can be accounted for solely in terms of the extension of processes and mechanisms occurring at the previous microevolutionary level On this view natural selection holds a central explanatory role in evolutionary theory one that presumably reaches back to Charles Darwin's *Origin of Species* a view also accompanied by the belief that the field of evolutionary biology is organized around a profound divide theories relying on strong selective factors and those appealing only to weak ones If one reads the new analyses presented in this volume by biologists historians and philosophers this divide seems to be collapsing at a rapid pace opening an era dedicated to the search for a new paradigm for the development of evolutionary biology Contrary to popular belief scholars position on natural selection is not in itself a significant discriminatory factor between most evolutionists In fact the intellectual space is quite limited if not non-existent between on the one hand Darwinists who play down the central role of natural selection in evolutionary explanations and on the other hand non-Darwinists who use it in a list of other evolutionary mechanisms The mechanism-centered approach to evolutionary biology is too incomplete to fully make sense of its development In this book the labels created under the traditional historiography Darwinian Revolution Eclipse of Darwinism Modern Synthesis Post-Synthetic Developments are thus re-evaluated This book will not only appeal to researchers working in evolutionary biology but also to historians and philosophers

Natural Selection George Christopher Williams, 1992 [Introduction to Natural Selection](#) Clifford Johnson, 1976 Genetic systems and fitness Evidence for selection The balanced polymorphism or the non-neutral equilibria Selection coefficients in natural populations Varying fitness and the unit of selection Quantitative traits and the selection effect Selection in retrospect and prospect **The Origin of Species by Means of Natural Selection** Charles Darwin, 1921 **Charles Darwin's Natural Selection** Charles Darwin, 1987-11-26 An original unpublished manuscript written before the *Origin of Species* which contains the references to journal articles and books that Darwin used in formulating his controversial ideas This volume has been edited and annotated and includes a cross-indexing to the *Origin*

Adaptation and Natural Selection George Christopher Williams, 2018-10-30 Biological evolution is a fact but the many conflicting theories of evolution remain controversial even today When *Adaptation and Natural Selection* was first published in 1966 it struck a powerful blow against those who argued for the concept of group selection the idea that evolution acts to select entire species rather than individuals Williams's famous work in favor of simple Darwinism over group selection has become a classic of science literature valued for its thorough and convincing argument and its relevance to many fields outside of biology Now with a new foreword by Richard Dawkins *Adaptation and Natural Selection* is an essential text for understanding the nature of scientific debate The All-sufficiency of Natural Selection August Weismann, 1893 **The Genetical Theory of Natural Selection** Sir Ronald Aylmer Fisher, 1999-10-21 This is a definitive edition of R A Fisher's classic It will include both Fisher's original 1930 text and that of a second edition of the book published in 1958 It also has a new foreword some unpublished material and private letters **On Natural Selection** Charles Darwin, 2005-09-06

Rothman exposes a major through remarkably almost completely neglected problem with Darwin's theory of evolution. Its two essential elements, natural selection and reproduction, are in important respects contradictory. In considering their relationship, Rothman makes the revolutionary claim that the evolution of life's complex and diverse reproductive mechanisms is not the consequence of natural selection. In so doing, he exposes the deepest question possible about life's nature: its reason for being. In meticulously detailed but accessible terms, he lays out the crux of the paradox and offers an intriguing solution within a naturalistic framework. In an ostensibly purposeless universe, somehow purposeful life has evolved. For all living things, there are two overarching purposes: survival and the creation of new life. Natural selection is about the survival of existing life but has no interest in life's future, whether it persists or perishes. By contrast, reproduction is only about the future of life and has no interest in existing life except as a means to an end. Where do these purposes come from? As Rothman demonstrates, at every level, life is wired to react to danger. Counterintuitively, without danger, life would neither have come into being nor evolved. In the same way, death drives the creation of new life and has propelled the evolution of the mechanisms of reproduction. Written with great clarity and informed by deep learning, this elegant, thoughtful work tackles some of the most challenging questions raised by the theory of evolution. Page 4 Cover
