

# NATURE'S NEWBORN

**Nature's Newborn.** A series of animal stories with a difference. In each episode, a different baby animal interacts with its parents, friends, and even its enemies to bring you a truly exciting look into their daily adventures, aspirations, and dreams in the wild. Each baby animal has its own character, and like children, they have their own likes and dislikes, sometimes even contradictory to their nature.

Gislason,2017-07-05 Preface Being a human is challenging Human life is a journey thorough time and space with many obstacles injury disease constant uncertainty and relentlessly difficult interactions with other humans Each human is the reincarnation of a long lineage of ancestors Species memory perceptual skills needs drives feelings desires and behaviors are built in and begin operating in utero Humans evolved from primate ancestors and retained features of mind and behavior that have been present in animals for hundreds of millions of years Urges desires designs feelings cry out from within and often surprise us as if we were the hosts to wild animals and spirits within that refuse to be identified or tamed Human behavior can be understood in relation to the whole spectrum of primate behaviors and social organizations Humans appear to have an eclectic combination of primate tendencies with elaboration of features such as tool making symbolic reasoning and spoken language Linda Stone suggested that Primates are a natural grouping of mammals that includes prosimians tree dwelling animals such as lemurs and tarsiers monkeys apes and humans Some of the physical characteristics that distinguish primates from other mammals are binocular vision and the grasping hand with mobile digits and flat nails Evolutionary trends characteristic of the Primate Order are most pronounced in humans and include prolongation of gestation of the fetus prolongation of the period of infant care and expansion and elaboration of the brain An important feature in the social life of many nonhuman primates is dominance and the formation of dominance hierarchies a dominant animal wins aggressive encounters with others and usually has greater access to resources such as food water or sexual partners Rather than viewing society and culture as real things an observer can recognize that humans live in groups that repeat and modify innate behaviors to produce prolific variations on a few underlying themes that are common to all societies A smart observer will consider the grouping characteristics of humans and discern basic patterns and problems underlying the apparent complexity of modern civilization The organization of society begins with small local clusters that link family groups into clans that are more or less cooperative units Clans associate forming bands that tend to affiliate with other bands forming tribes looser affiliations that occupy larger geographic areas The band tribal structure emerges from ancient animal groupings Patterns of organization rules and institutions that regulate human behavior are in flux and will continue to be unstable As human populations expand and interactions become increasingly complex innate abilities are stretched and distorted The ability of individuals to relate to other humans remains limited and limits the effective management of enlarging groups Managers and leaders do not become smarter as the organizations they lead become larger It is axiomatic that organizations that exceed a threshold number become dysfunctional It is matter of empirical study to recognize group size thresholds and too little is known about the cognitive limitations of leaders **Nobel Prizes And Nature's Surprises**

Erling Norrby,2013-10-10 Each year the Nobel Prizes in the natural sciences reveal amazing discoveries New milestones in the relentless advance of science are identified The growth of knowledge and its evolution can be researched in the Nobel archives where nominations are kept secret for 50 years after the awards have been made They represent a treasure for real time assessment of science Norrby's earlier book Nobel Prizes and Life Sciences 2010 examined the unique archival records until 1959 The present book takes us up to 1962 surveying a range of dazzling discoveries All prizes in immunology are reviewed Their impact on our capacity to control infectious diseases and transplant organs are highlighted The Nobel year 1962 is exceptional in recognizing the most major advance in biology since Darwin in 1859 presented his theory of evolution This was the dramatic discovery of the double helix structure of DNA by Watson and Crick in 1953 The era of molecular biology had begun Its explosive development continues into the present **Nature**,1917 **The Guide to Nature**,1926
