Nanoliquid Processes for Electronic Devices Tatsuya Shimoda,2019-02-05 This book summarizes the results of the research on how to make small electronic devices with high properties by using simple liquid processes such as coating self assembling and printing especially focusing on devices composed of silicon and oxide materials It describes syntheses and analyses of solution materials formations of solid thin films from solutions newly developed patterning methods to make devices and characterization of the developed devices In the first part of the book the research on liquid silicon Si materials is described Because the use of a liquid material is a quite new idea for Si devices this book is the first one to describe liquid Si materials for electronic devices Si devices as typified by MOS FET have been produced by using solid and gas materials This volume precisely describes a series of processes from material synthesis to device fabrication for those who are interested and are will be engaged in liquid Si related work In the latter part of the book a general method of how to make good oxide films from solutions and a new imprinting method to make nanosized patterns are introduced For making oxide films with high quality the designing of the solution is crucial If a solution is designed properly a gel material called cluster gel can be formed which is able to be imprinted to form nanosized patterns The anticipated readers of this book are researchers engineers and students who are interested in solution and printing processes for making devices More generally this book will also provide guidelines for corporate managers and executives who are responsible for making strategies for future manufacturing processes *Materials Processes Of Electron Devices* Knoll M., **Materials and Process**
