

# 1. DIFFERENTIATION

Throughout this section, let  $I$  be an open interval (not necessarily bounded) and let  $f$  be a real-valued function defined on  $I$ .

**Definition 1.1.** Let  $c \in I$ . We say that  $f$  is differentiable at  $c$  if the following limit exists:

$$\lim_{x \rightarrow c} \frac{f(x) - f(c)}{x - c}.$$

In this case, we write  $f'(c)$  for the above limit and we call it the derivative of  $f$  at  $c$ . We say that if  $f$  is differentiable on  $I$  if  $f'(x)$  exists for every point  $x$  in  $I$ .

**Proposition 1.2.** Let  $c \in I$ . Then  $f'(c)$  exists if and only if there is a function  $\varphi$  defined on  $I$  such that the function  $\varphi$  is continuous at  $c$  and

$$f(x) - f(c) = \varphi(x)(x - c)$$

for all  $x \in I$ .

In this case,  $\varphi(c) = f'(c)$ .

*Proof.* Assume that  $f'(c)$  exists. Define a function  $\varphi : I \rightarrow \mathbb{R}$  by

$$\varphi(x) = \begin{cases} \frac{f(x) - f(c)}{x - c} & \text{if } x \neq c; \\ f'(c) & \text{if } x = c. \end{cases}$$

Clearly, we have  $f(x) - f(c) = \varphi(x)(x - c)$  for all  $x \in I$ . We want to show that the function  $\varphi$  is continuous at  $c$ . In fact, let  $\varepsilon > 0$ , by the definition of the limit of a function, there is  $\delta > 0$  such that

$$|f'(c) - \frac{f(x) - f(c)}{x - c}| < \varepsilon$$

whenever  $x \in I$  with  $0 < |x - c| < \delta$ . Therefore, we have  $|f'(c) - \varphi(x)| < \varepsilon$  as  $x \in I$  with  $0 < |x - c| < \delta$ . Since  $\varphi(c) = f'(c)$ , we have  $|f'(c) - \varphi(x)| < \varepsilon$  as  $x \in I$  with  $|x - c| < \delta$ , hence the function  $\varphi$  is continuous at  $c$  as desired.

The converse is clear since  $\varphi(x) = \frac{f(x) - f(c)}{x - c}$  if  $x \neq c$ . The proof is complete.  $\square$

**Proposition 1.3.** Using the notation as above, if  $f$  is differentiable at  $c$ , then  $f$  is continuous at  $c$ .

*Proof.* By using Proposition 1.2, if  $f'(c)$  exists, then there is a function  $\varphi$  defined on  $I$  such that the function  $\varphi$  is continuous at  $c$  and we have  $f(x) - f(c) = \varphi(x)(x - c)$  for all  $x \in I$ . This implies that  $\lim_{x \rightarrow c} f(x) = f(c)$ , so  $f$  is continuous at  $c$  as desired.  $\square$

**Remark 1.4.** In general, the converse of Proposition 1.3 does not hold, for example, the function  $f(x) := |x|$  is a continuous function on  $\mathbb{R}$  but  $f'(0)$  does not exist.

**Mathematical Analysis II** Vladimir A. Zorich, 2004-01-22 This work by Zorich on Mathematical Analysis constitutes a thorough first course in real analysis leading from the most elementary facts about real numbers to such advanced topics as differential forms on manifolds asymptotic methods Fourier Laplace and Legendre transforms and elliptic functions

Mathematical Analysis II Claudio Canuto, Anita Tabacco, 2011-01-01 The purpose of this textbook is to present an array of topics in Calculus and conceptually follow our previous effort Mathematical Analysis I The present material is partly found in fact in the syllabus of the typical second lecture course in Calculus as offered in most Italian universities While the subject matter known as Calculus 1 is more or less standard and concerns real functions of real variables the topics of a course on Calculus 2 can vary a lot resulting in a bigger flexibility For these reasons the Authors tried to cover a wide range of subjects not forgetting that the number of credits the current programme specifications confers to a second Calculus course is not comparable to the amount of content gathered here The reminders disseminated in the text make the chapters more independent from one another allowing the reader to jump back and forth and thus enhancing the versatility of the book On the website <http://calvino.polito.it/canuto/tabacco/analisi2/> the interested reader may find the rigorous explanation of the results that are merely stated without proof in the book together with useful additional material The Authors have completely omitted the proofs whose technical aspects prevail over the fundamental notions and ideas The large number of exercises gathered according to the main topics at the end of each chapter should help the student put his improvements to the test The solution to all exercises is provided and very often the procedure for solving is outlined Mathematical Analysis II V. A. Zorich, 2016-02-22 This second English edition of a very popular two volume work presents a thorough first course in analysis leading from real numbers to such advanced topics as differential forms on manifolds asymptotic methods Fourier Laplace and Legendre transforms elliptic functions and distributions Especially notable in this course are the clearly expressed orientation toward the natural sciences and the informal exploration of the essence and the roots of the basic concepts and theorems of calculus Clarity of exposition is matched by a wealth of instructive exercises problems and fresh applications to areas seldom touched on in textbooks on real analysis The main difference between the second and first English editions is the addition of a series of appendices to each volume There are six of them in the first volume and five in the second The subjects of these appendices are diverse They are meant to be useful to both students in mathematics and physics and teachers who may be motivated by different goals Some of the appendices are surveys both prospective and retrospective The final survey establishes important conceptual connections between analysis and other parts of mathematics This second volume presents classical analysis in its current form as part of a unified mathematics It shows how analysis interacts with other modern fields of mathematics such as algebra differential geometry differential equations complex analysis and functional analysis This book provides a firm foundation for advanced work in any of these directions

*Mathematical Analysis I* V. A. Zorich, 2018-04-25 This second edition of a very popular two volume work presents a thorough first course in analysis leading from real numbers to such advanced topics as differential forms on manifolds asymptotic methods Fourier Laplace and Legendre transforms elliptic functions and distributions Especially notable in this course are the clearly expressed orientation toward the natural sciences and the informal exploration of the essence and the roots of the basic concepts and theorems of calculus Clarity of exposition is matched by a wealth of instructive exercises problems and fresh applications to areas seldom touched on in textbooks on real analysis The main difference between the second and first editions is the addition of a series of appendices to each volume There are six of them in the first volume and five in the second The subjects of these appendices are diverse They are meant to be useful to both students in mathematics and physics and teachers who may be motivated by different goals Some of the appendices are surveys both prospective and retrospective The final survey establishes important conceptual connections between analysis and other parts of mathematics The first volume constitutes a complete course in one variable calculus along with the multivariable differential calculus elucidated in an up to date clear manner with a pleasant geometric and natural sciences flavor

*Mathematical Analysis II* Claudio Canuto, Anita Tabacco, 2015-02-07 The purpose of the volume is to provide a support textbook for a second lecture course on Mathematical Analysis The contents are organised to suit in particular students of Engineering Computer Science and Physics all areas in which mathematical tools play a crucial role The basic notions and methods concerning integral and differential calculus for multivariable functions series of functions and ordinary differential equations are presented in a manner that elicits critical reading and prompts a hands on approach to concrete applications The pedagogical layout echoes the one used in the companion text Mathematical Analysis I The book's structure has a specifically designed modular nature which allows for great flexibility in the preparation of a lecture course on Mathematical Analysis The style privileges clarity in the exposition and a linear progression through the theory The material is organised on two levels The first reflected in this book allows students to grasp the essential ideas familiarise with the corresponding key techniques and find the proofs of the main results The second level enables the strongly motivated reader to explore further into the subject by studying also the material contained in the appendices Definitions are enriched by many examples which illustrate the properties discussed A host of solved exercises complete the text at least half of which guide the reader to the solution This new edition features additional material with the aim of matching the widest range of educational choices for a second course of Mathematical Analysis

**Analysis II** Terence Tao, 2016-08-22 This is part two of a two volume book on real analysis and is intended for senior undergraduate students of mathematics who have already been exposed to calculus The emphasis is on rigour and foundations of analysis Beginning with the construction of the number systems and set theory the book discusses the basics of analysis limits series continuity differentiation Riemann integration through to power series several variable calculus and Fourier analysis and then finally the Lebesgue integral These are almost entirely set in the concrete setting of the real line and Euclidean spaces although there is some material on abstract metric and topological spaces The book also has appendices on mathematical logic and the decimal system The entire text omitting some less central topics can be taught in two quarters of 25 30 lectures each The course material is deeply intertwined with the exercises as it is intended that the student actively learn the material and practice thinking and writing rigorously by proving several of the key results in the theory
