Multiservisnye Atmseti:

Large Multiservice Loss Models and Applications to ATM Networks François Théberge, 1996 The problem of estimating call blocking probabilities in ATM networks is addressed in this thesis We develop a new two step iterated framework for call acceptance control CAC In the first step we define a new variable bit rate VBR traffic descriptor called effective rate and we use a known effective bandwidth technique in the second step to estimate cell loss This approach yields decoupled estimators at the call level so that loss systems models can be used to perform network analysis Our work on loss systems is divided in three parts single link problems reservation and network problems In the single link context we generalize existing asymptotic approximation formulae for blocking probabilities and propose a uniform estimate under light up to critical loading conditions We present the salient features of commonly used reservation schemes while proposing and reviewing ways to estimate blocking probabilities in each case In the case of networks we provide an overview of classical techniques to evaluate blocking probabilities such as fixed point methods We propose a novel fixed point technique for large capacity systems which yields dramatic reduction in computational complexity We also analyze loss networks from an analytic point of view using the Laplace method and a change of probability law technique We obtain asymptotic formulae for every loading conditions and a number of asymptotic results regarding network behavior Many numerical examples are provided as well as a model example where we illustrate how our asymptotic formulae can be used to perform network optimization
