Multivariable Feedback: A Quasi-Classical Approach Y. S. Hung,A. G. J. MacFarlane,1982 The purpose of the work presented here is the development of a computer aided analysis design approach to linear multivariable feedback systems having the following attributes In specifying a required feedback control system behaviour the designer will be principally concerned with three aspects of his specification stability performance and robustness By robustness is meant the ability to maintain some specified degree of stability and performance in the face of a stipulated amount of plant variation Stability can be handled using the generalized Nyquist stability criterion and the associated generalized root locus method However although generalized Nyquist diagrams give precise information about closed loop stability they do not give an adequate characterization of closed loop performance The feedback control design problem is considered here in the context of computer aided design CAD using interactive graphic terminals and appropriate programs have been developed and tested for the techniques described *Large Scale Systems: Theory and Applications 1989* K. Reinisch,M. Thoma,1990-06-08 The papers present new trends on the development of theory and applications in the field of large scale systems analysis planning and control The issues discussed are proving to be of great importance as systems of growing complexity are found in all fields of human activities often developed by economic organizational and technological effects The papers are divided into three main areas of interest Modelling Analysis Basic Controls Superordinate Controls and Decisions Applications
