**Brain Stimulation** Jean-Pascal Lefaucheur,2013-11-11 Invasive stimulation of the motor precentral cortex using surgically implanted epidural electrodes is indicated for the treatment of neuropathic pain that is refractory to medical

treatment Controlled trials have demonstrated the efficacy of epidural motor cortex stimulation MCS but MCS outcome remains variable and validated criteria for selecting good candidates for implantation are lacking Repetitive transcranial magnetic stimulation rTMS is a noninvasive approach that could be used as a preoperative tool to predict MCS outcome and also could serve as a therapeutic procedure in itself to treat pain disorders This requires repeated rTMS sessions and a maintenance protocol Other studies have also demonstrated the efficacy of transcranial direct current stimulation tDCS in relieving chronic pain syndromes The most studied target is the precentral cortex but other targets such as the prefrontal and parietal cortices could be of interest The analgesic effects of cortical stimulation relate to the activation of various circuits modulating neural activities in remote structures such as the thalamus limbic cortex insula or descending inhibitory controls In addition to the treatment of refractory neuropathic pain by epidural MCS new developments of this type of strategy are ongoing for other types of pain syndrome and stimulation techniques
