Paint and Coating Testing Manual,

Paint and Surface Coatings R Lambourne, T A Strivens, 1999-08-23 This second edition of an established and well received book has been carefully revised in many instances by the original authors and enlarged by the addition of two completely new chapters These deal with the use of computers in the paint industry and with the increasingly important subject of health and safety The chapter on pigments has also been re written by an author new to this edition It was the editor's intention in the first edition to provide science graduates entering the paint industry with a bridge between academia and the applied science and technology of paints The great strength and appeal of this book remains that it deals with the technology of paints and surface coatings while also providing a basic understanding of the chemistry and physics of coatings Extensive revision of first edition New chapter on computers and modelling New chapter on health and safety

Introduction to Paint Chemistry and principles of paint technology, Fourth Edition John Bentley, G.P.A. Turner, 1997-09-25

This work provides a comprehensive introduction to paint technology supported by the relevant aspects of chemistry and physics. It covers the basic science and is devoted to paint composition, formulation and drying mechanisms, paint ingredients such as solvents, pigments and additives, and the different paint groups by chemical type. Throughout the book, the authors emphasize the factors which govern the choice of a particular paint for a particular job. This new edition has been thoroughly revised to modernize and clarify the text. Areas of new development have been added, including environmental impacts, safety issues and modern paint making techniques. Nomenclature and units have also been updated and a glossary of technical terms added. This book should be of interest as a course text for paint technology students and technical staff concerned with the paint industry.

Surface Coating Technology Handbook NPCS Board of Consultants & Engineers, 2009-10-01

Surface coating is in use since long back and is rapidly increasing with the development of civilization. There has been considerable impact in this field. Surface coating technology specializes in finding out engineering solutions to all the critical production problems related to coating the products on a continuous and consistent basis in your production plant. Surface coating can be defined as a process in which a substance is applied to other materials to change the surface properties such as colour, gloss, resistance to wear or chemical attack or permeability without changing the bulk properties. Production of surface coating by any method depends primarily on two factors: the cohesion between the film-forming substances and the adhesion between the film and the substrate. The development of science and technology revolutionized the surface coating industry in the progressive countries of the world. Surface coating technology involves the use of various types of products such as resins, oils, pigments, polymers, varnishes, plasticizers, emulsions, etc. We have completely replaced costly petroleum solvents with water and we get cheaper finished products with no evaporation loss and fire hazards. Paint is any liquid, liquefiable or mastic composition which, after application to a substrate in a thin layer, is converted to an opaque solid film. It is most commonly used to protect colour or provide texture to objects. The paint industry volume in India has been growing at 15% per annum for quite some years now. Varnish is one of the important parts of the surface coating industry. They are used to change the surface gloss, making the surface more matte or higher gloss, or to provide the various areas of a painting with a more unified finish. Plasticizer plays an important role in the formation of polyvinylchloride (PVC). It is also used to plasticize the polymers. Polymers are divided into three different types: linear polymers, branched polymers, and cross-linked polymers. Polymer Energy system is an award-winning innovative proprietary process to convert waste plastics into renewable energy. On the basis of value added, Indian share of plastic products industry is about 0.5% of national GDP. This book basically deals with principles of film formation, evaporation of solvent from a solution, chemistry and properties of drying, and other oils, glyceride structure and film formation, the size of polymer molecules, processing of oil and resin, inorganic pigments, classification by chemical constitution, azo pigments, organic pigments in architectural decorative, organic pigments in industrial finishes.
