length exerts a power equivalent due to the force exerted hence we find that a long crank is more powerful than a short one although the force exerted be alike The many inventors of the rotary engines do not in all cases ignore the application of this natural law but they certainly lessen the power in proportion to the area exposed to the steam It may be argued that what is lost by the absence of the crank is gained by the eccentricity of the piston and the velocity available but these attainments are counteracted by the liability of all the working parts to disarrangement and thereby cause a leakage of the steam From these facts it may not be wondered at that the ordinary cylinder and piston with a reciprocal motion still takes the lead as a prime mover Enough has now been said to enable the formation of a correct idea as to what is the best class of engine for marine purposes transmission of power now only About the Publisher Forgotten Books publishes hundreds of thousands of rare and classic books Find more at [www.forgottenbooks.com](http://www.forgottenbooks.com) This book is a reproduction of an important historical work Forgotten Books uses state of the art technology to digitally reconstruct the work preserving the original format whilst repairing imperfections present in the aged copy In rare cases an imperfection in the original such as a blemish or missing page may be replicated in our edition We do however repair the vast majority of imperfections successfully any imperfections that remain are intentionally left to preserve the state of such historical works *Marine Engineering & Shipping Age*, 1921
