Assembly of Life Sciences (U.S.). Committee on Nitrite and Alternative Curing Agents in Food, 1981 Abstract

This first volume of a 2 volume report attempts to assess the health risks associated with overall exposure to nitrate, nitrite and N-nitroso compounds with emphasis on the risks from natural and supplemented nitrate and nitrite in foods and the use of nitrite as a food preservative. An evaluation was made of the toxicologic and carcinogenic significance of exposure to these chemical species and their potential health risks. A number of conclusions are developed from this evaluative report. These include: nitrate is neither carcinogenic nor mutagenic; nitrite is not a direct acting carcinogen; most N-nitroso compounds are carcinogenic in laboratory animals but the experimental data are of limited value in predicting their quantitative risk to humans; the nitrosation-inhibiting effects of ascorbate and other substances have been established and due to possible health risk in using nitrate as a curing agent a search for alternatives should be continued. The use of nitrate and nitrite in foods and the chemistry of these materials are discussed. w3
