Computational Aspects of Linear Control Claude Brezinski,2013-12-01 Many devices we say dynamical systems or simply systems behave like black boxes they receive an input this input is transformed following some laws usually a differential equation and an output is observed The problem is to regulate the input in order to control the output that is for obtaining a desired output Such a mechanism where the input is modified according to the output measured is called feedback The study and design of such automatic processes is called control theory As we will see the term system embraces any device and control theory has a wide variety of applications in the real world Control theory is an interdisciplinary domain at the junction of differential and difference equations system theory and statistics Moreover the solution of a control problem involves many topics of numerical analysis and leads to many interesting computational problems linear algebra QR SVD projections Schur complement structured matrices localization of eigenvalues computation of the rank Jordan normal form Sylvester and other equations systems of linear equations regularization etc root localization for polynomials inversion of the Laplace transform computation of the matrix exponential approximation theory orthogonal polynomials Padé approximation continued fractions and linear fractional transformations optimization least squares dynamic programming etc So control theory is also a good excuse for presenting various sometimes unrelated issues of numerical analysis and the procedures for their solution This book is not a book on control

Linear Control System Analysis and Design with MATLAB Constantine H. Houpis,Stuart N. Sheldon,2013-10-30 This book uses numerous in depth explanations diagrams calculations and tables to provide an intensive overview of modern control theory and control system design Mathematics is kept to a minimum and engineering applications are stressed

throughout Completely updated and packed with student friendly features the sixth edition presents a range of updated examples using MATLAB as well as an appendix listing MATLAB functions for optimizing control system analysis and design Over 75 percent of the problems presented in the previous edition have been revised or replaced ***Numerical Methods for Large-Scale Linear Time-Varying Control Systems and related Differential Matrix Equations*** Norman Lang,2018 This thesis is concerned with the linear quadratic optimal control and model order reduction MOR of large scale linear time varying LTV control systems In the first two parts particular attention is paid to a tracking type finite time optimal control problem with application to an inverse heat conduction problem and the balanced truncation BT MOR method for LTV systems In both fields of application the efficient solution of differential matrix equations DMEs is of major importance The third and largest part deals with the application of implicit time integration methods to these matrix valued ordinary differential equations In this context in particular the rather new class of peer methods is introduced Further for the efficient solution of large scale DMEs in practice low rank solution strategies are inevitable Here low rank time integrators based on a symmetric indefinite factored representation of the right hand sides and the solution approximations of the DMEs are presented In contrast to the classical low rank Cholesky type factorization this avoids complex arithmetic and tricky implementations and algorithms Both low rank approaches are compared for numerous implicit time integration methods

University of Michigan. College of Engineering,1987 ***Bilinear Control Systems*** David Elliott,2009-09-01 The mathematical theory of control became a field of study half a century ago in attempts to clarify and organize some challenging practical problems and the methods used to solve them It is known for the breadth of the mathematics it uses and its cross disciplinary vigor Its literature which can be found in Section 93 of Mathematical Reviews was at one time dominated by the theory of linear control systems which

mathematically are described by linear differential equations forced by additive control inputs. That theory led to well regarded numerical and symbolic computational packages for control analysis and design. Nonlinear control problems are also important in these either the underlying dynamical system is nonlinear or the controls are applied in an additive way. The last four decades have seen the development of theoretical work on nonlinear control problems based on differential manifold theory, nonlinear analysis and several other mathematical disciplines. Many of the problems that had been solved in linear control theory plus others that are new and distinctly nonlinear have been addressed, some resulting general definitions and theorems are adapted in this book to the bilinear case.

Control Perspectives on Numerical Algorithms and Matrix Problems Amit Bhaya, Eugenius Kaszkurewicz, 2006-03-01

This book organizes the analysis and design of iterative numerical methods from a control perspective. A variety of applications are discussed including iterative methods for linear and nonlinear systems of equations, neural networks for linear and quadratic programming problems and integration and shooting methods for ordinary differential equations.

Journal of Dynamic Systems, Measurement, and Control, 2001

Publishes theoretical and applied original papers in dynamic systems. Theoretical papers present new theoretical developments and knowledge for controls of dynamical systems together with clear engineering motivation for the new theory. Applied papers include modeling, simulation and corroboration of theory with emphasis on demonstrated practicality.

Optimization of Linear Control Systems F A Aliev, V B Larin, 1998-11-19

The authors present analytical methods for synthesis of linear stationary and periodical optimal controlled systems and create effective computational algorithms for synthesis of optimal regulators and filters. The procedures of Youla, Jabr, Bongiorno 1976 and Desoer, Lin, Murray, Saeks 1980 are special cases of this procedure. The monograph also includes original computational algorithms, solutions of usual and generalized Lyapunov and Riccati equations, polynomial matrix factorization and illustrates the effectiveness of these algorithms by examples in the field of numerical methods for optimization of linear controlled systems.

Modern Control System Theory and Design Stanley M. Shinners, 1992-03-25

Offers unified treatment of conventional and modern continuous and discrete control theory and demonstrates how to apply the theory to realistic control system design problems. Along with linear and nonlinear, digital and optimal control systems, it presents four case studies of actual designs. The majority of solutions contained in the book and the problems at the ends of the chapters were generated using the commercial software package MATLAB and is available free to the users of the book by returning a postcard contained with the book to the MathWorks Inc. This software also contains the following features: utilities created to enhance MATLAB and several of the MathWorks toolboxes, Tutorial File which contains the essentials necessary to understand the MATLAB interface, other books require additional books for full
