Universitatis Babeş-Bolyai Universitatea "Babeş-Bolyai.",2010 **Numerical Approximation of Hyperbolic Systems of Conservation Laws** Edwige Godlewski,Pierre-Arnaud Raviart,2013-11-21 This work is devoted to the theory and approximation of nonlinear hyperbolic systems of conservation laws in one or two space variables It follows directly a previous publication on hyperbolic systems of conservation laws by the same authors and we shall make frequent references to Godlewski and Raviart 1991 hereafter noted G R though the present volume can be read independently This earlier publication apart from a first chapter especially covered the scalar case Thus we shall detail here neither the mathematical theory of multidimensional scalar conservation laws nor their approximation in the one dimensional case by finite difference conservative schemes both of which were treated in G R but we shall mostly consider systems The theory for systems is in fact much more difficult and not at all completed This explains why we shall mainly concentrate on some theoretical aspects that are needed in the applications such as the solution of the Riemann problem with occasional insights into more sophisticated problems The present book is divided into six chapters including an introductory chapter For the reader's convenience we shall resume in this Introduction the notions that are necessary for a self sufficient understanding of this book the main definitions of hyperbolicity weak solutions and entropy present the practical examples that will be thoroughly developed in the following chapters and recall the main results concerning the scalar case Mathematical Reviews ,2004

Stability Theory for Dynamic Equations on Time Scales Anatoly A. Martynyuk,2016-09-22 This monograph is a first in the world to present three approaches for stability analysis of solutions of dynamic equations The first approach is based on the application of dynamic integral inequalities and the fundamental matrix of solutions of linear approximation of dynamic equations The second is based on the generalization of the direct Lyapunov's method for equations on time scales using scalar vector and matrix valued auxiliary functions The third approach is the application of auxiliary functions scalar vector or matrix valued ones in combination with differential dynamic inequalities This is an alternative comparison method developed for time continuous and time discrete systems In recent decades automatic control theory in the study of air and spacecraft dynamics and in other areas of modern applied mathematics has encountered problems in the analysis of the behavior of solutions of time continuous discrete linear and or nonlinear equations of perturbed motion In the book *Men of Mathematics* 1937 E T Bell wrote A major task of mathematics today is to harmonize the continuous and the discrete to include them in one comprehensive mathematics and to eliminate obscurity from both Mathematical analysis on time scales accomplishes exactly this This research has potential applications in such areas as theoretical and applied mechanics neurodynamics mathematical biology and finance among others **Scientific and Technical Aerospace Reports** ,1965

Analysis and Simulation of Chaotic Systems Frank C. Hoppensteadt,2000-01-21 Beginning with realistic mathematical or verbal models of physical or biological phenomena the author derives tractable models for further mathematical analysis or computer simulations For the most part derivations are based on perturbation methods and the majority of the text is

devoted to careful derivations of implicit function theorems the method of averaging and quasi static state approximation methods The duality between stability and perturbation is developed and used relying heavily on the concept of stability under persistent disturbances Relevant topics about linear systems nonlinear oscillations and stability methods for difference differential delay integro differential and ordinary and partial differential equations are developed throughout the book For the second edition the author has restructured the chapters placing special emphasis on introductory materials in Chapters 1 and 2 as distinct from presentation materials in Chapters 3 through 8 In addition more material on bifurcations from the point of view of canonical models sections on randomly perturbed systems and several new computer simulations have been added
