Modeling Microprocessor Performance:

Modeling Microprocessor Performance Bibiche Geuskens, Kenneth Rose, 2012-12-06 Modeling Microprocessor Performance focuses on the development of a design and evaluation tool named RIPE Rensselaer Interconnect Performance Estimator This tool analyzes the impact on wireability clock frequency power dissipation and the reliability of single chip CMOS microprocessors as a function of interconnect device circuit design and architectural parameters It can accurately predict the overall performance of existing microprocessor systems For the three major microprocessor architectures DEC PowerPC and Intel the results have shown agreement within 10% on key parameters The models cover a broad range of issues that relate to the implementation and performance of single chip CMOS microprocessors The book contains a detailed discussion of the various models and the underlying assumptions based on actual design practices As such RIPE and its models provide an insightful tool into single chip microprocessor design and its performance aspects At the same time it provides design and process engineers with the capability to model evaluate compare and optimize single chip microprocessor systems using advanced technology and design techniques at an early design stage without costly and time consuming implementation RIPE and its models demonstrate the factors which must be considered when estimating tradeoffs in device and interconnect technology and architecture design on microprocessor performance Single and Multi-CPU

Performance Modeling for Embedded Systems Trevor Conrad Meyerowitz, 2008 **Analytical Modeling of Modern Microprocessor Performance**, 2006 As the number of transistors integrated on a chip continues to increase a growing challenge is accurately modeling performance in the early stages of processor design Analytical modeling is an alternative to detailed simulation with the potential to shorten the development cycle and provide additional insight This thesis proposes hybrid analytical models to predict the impact of pending cache hits hardware prefetching and realistic miss status holding register MSHR resources on superscalar performance We propose techniques to model the non negligible influences of pending hits and the fine grained selection of instruction profile window blocks on the accuracy of hybrid analytical models We also present techniques to estimate the performance impact of data prefetching by modeling the timeliness of prefetches and to account for a limited number of MSHRs by restricting the size of profile window blocks As with earlier hybrid analytical models our approach is roughly two orders of magnitude faster than detailed simulations Overall our techniques reduce the error of our baseline from 39.7% to 10.3% when the number of MSHRs is unlimited When modeling a processor with data prefetching a limited number of MSHRs or both our techniques result in an average error of 13.8%, 9.5% and 17.8% respectively Moreover this thesis proposes analytical models for predicting the cache contention and throughput of heavily fine grained multithreaded architectures such as Sun Microsystems Niagara We first propose a novel probabilistic model using statistics characterizing individual threads run in isolation as inputs to accurately predict the number of extra cache misses due to cache contention among a large number of threads We then present a Markov chain model for analytically

estimating the throughput of multicore fine grained multithreaded architectures Combined the two models accurately predict system throughput obtained from a detailed simulator with an average
