**Spatiotemporal Models of Population and Community Dynamics** T. Czarán, 1998 This book presents a comprehensive typology and a comprehensible description of spatiotemporal models used in population dynamics. The main types included are reaction diffusion systems, patch models, metapopulation approaches, host-parasitoid models, cellular automata, interacting particle systems, tessellations, and distance models. The models are introduced through examples and with informative verbal explanations to help understanding. Some of the cellular automaton examples are models not yet published elsewhere. Possible extensions of certain model types are suggested.      *Stochastic Population Models* James H. Matis, Thomas R. Kiffe, 2012-12-06 This monograph has been heavily influenced by two books. One is Renshaw's 82 work on modeling biological populations in space and time. It was published as we were busily engaged in modeling African bee dispersal and provided strong affirmation for the stochastic basis for our ecological modeling efforts. The other is the third edition of Jacquez's 28 classic book on compartmental analysis. He reviews stochastic compartmental analysis and utilizes generating functions in this edition to derive many useful results. We interpreted Jacquez's use of generating functions as a message that the day had come for modeling practitioners to consider using this powerful approach as a model building tool. We were inspired by the idea of using generating functions and related methods for two purposes. The first is to integrate seamlessly our previous research centering in stochastic compartmental modeling with our more recent research focusing on stochastic population modeling. The second related purpose is to present some key research results of practical application in a natural user friendly way to the large user communities of compartmental and biological population modelers. One general goal of this monograph is to make a case for the practical utility of the various stochastic population models. In accordance with this objective we have chosen to illustrate the various stochastic models using four primary applications described in Chapter 2. In so doing this monograph is based largely on our own published work.      Population Dynamics and the Tribolium Model: Genetics and Demography Robert F. Costantino, Robert A. Desharnais, 2012-12-06 The study of populations is becoming increasingly focused on dynamics. We believe there are two reasons for this trend. The first is the impact of nonlinear dynamics with its exciting ideas and colorful language, bifurcations, domains of attraction, chaos, fractals, strange attractors. Complexity, which is so very much a part of biology now, seems to be also a part of mathematics. A second trend is the accessibility of the new concepts. The barriers to communication between theorist and experimentalist seem less impenetrable. The active participation of the experimentalist means that the theory will obtain substance. Our role is the application of the theory of dynamics to the analysis of biological populations. We began our work early in 1979 by writing an

ordinary differential equation for the rate of change in adult numbers which was based on an equilibrium model proposed a decade earlier. During the next few months we filled our notebooks with straightforward deductions from the model and its associated biological implications. Slowly some of the biological observations were explained and papers followed on a variety of topics: genetic and demographic stability, stationary probability distributions for population size, population growth as a birth-death process, natural selection and density dependent population growth, genetic disequilibrium and the stationary stochastic dynamics of adult numbers.

*An Introduction to Structured Population Dynamics* J. M. Cushing, 1998-01-01 This monograph introduces the theory of structured population dynamics and its applications focusing on the asymptotic dynamics of deterministic models.

Population and Community Ecology for Insect Management and Conservation Johann Baumgartner, Pietro Brandmayr, Bryan F. J. Manly, 2020-03-09 One of the themes of the 20th International Congress of Entomology held in Florence in August 1996 was Ecology and Population Dynamics with papers presented on single species dynamics, population interactions and community ecology. This book contains a selection of the papers that were presented and gives a late 1990s picture of the latest research in this fast developing area.

Spatial Ecology Stephen Cantrell, Chris Cosner, Shigui Ruan, 2009-08-05 Exploring the relationship between mathematics and ecology. Spatial Ecology focuses on some important emerging challenges in the field. These challenges consist of understanding the impact of space on community structure, incorporating the scale and structure of landscapes into mathematical models and developing connections between spatial ecology.

**Mathematical Modelling of Environmental and Ecological Systems** J. B. Shukla, 1987 This volume contains a cross section of the papers presented at the International Symposium on Mathematical Modelling of Ecological, Environmental and Biological Systems held in Kanpur, India, in August 1985. The choice of topics emphasizes many aspects of ecological and environmental matters including air and water pollution, ecotoxicology, resource management, epidemiology and population and community ecology. It is intended that this volume will focus international attention upon some problems in the ecological and environmental sciences that can be impacted by mathematical modelling and analysis.

**Modelling Biological Populations in Space and Time** Eric Renshaw, 1993-08-26 This volume develops a unifying approach to population studies, emphasising the interplay between modelling and experimentation. Throughout, mathematicians and biologists are provided with a framework within which population dynamics can be fully explored and understood. Aspects of population dynamics covered include birth, death and logistic processes, competition and predator-prey relationships, chaos, reaction time delays, fluctuating environments, spatial systems, velocities of spread, epidemics and spatial branching structures. Both deterministic and stochastic models are considered. Whilst the more theoretically orientated sections will appeal to mathematical biologists, the material is presented so that readers with little mathematical expertise can bypass these without losing the main flow of the text.
