**Modern Biogeochemistry** Vladimir N. Bashkin, 2006-12-29 At present quantitative ecological risk assessment is widely used in different contexts however very often without an understanding of the natural mechanisms that drive the processes of environmental and human risk Its application is often accompanied by high uncertainty about risk values On the other hand the sustainability of modern technoecosystems is known because of their natural biogeochemical cycling that has been transformed to various extents by anthropogenic studies Accordingly our understanding of the principal mechanisms that drive the biogeochemical food webs allows us to present a quantitative ecological risk assessment and to propose technological solutions for management of various ERA enterprises It also enables us to devise a powerful mechanism for ecological insurance to assign responsibilities and protect rights while managing the control of damage from natural and anthropogenic accidents and catastrophes *Modern Biogeochemistry* V.N.
