## Chromosomes, Genes and DNA

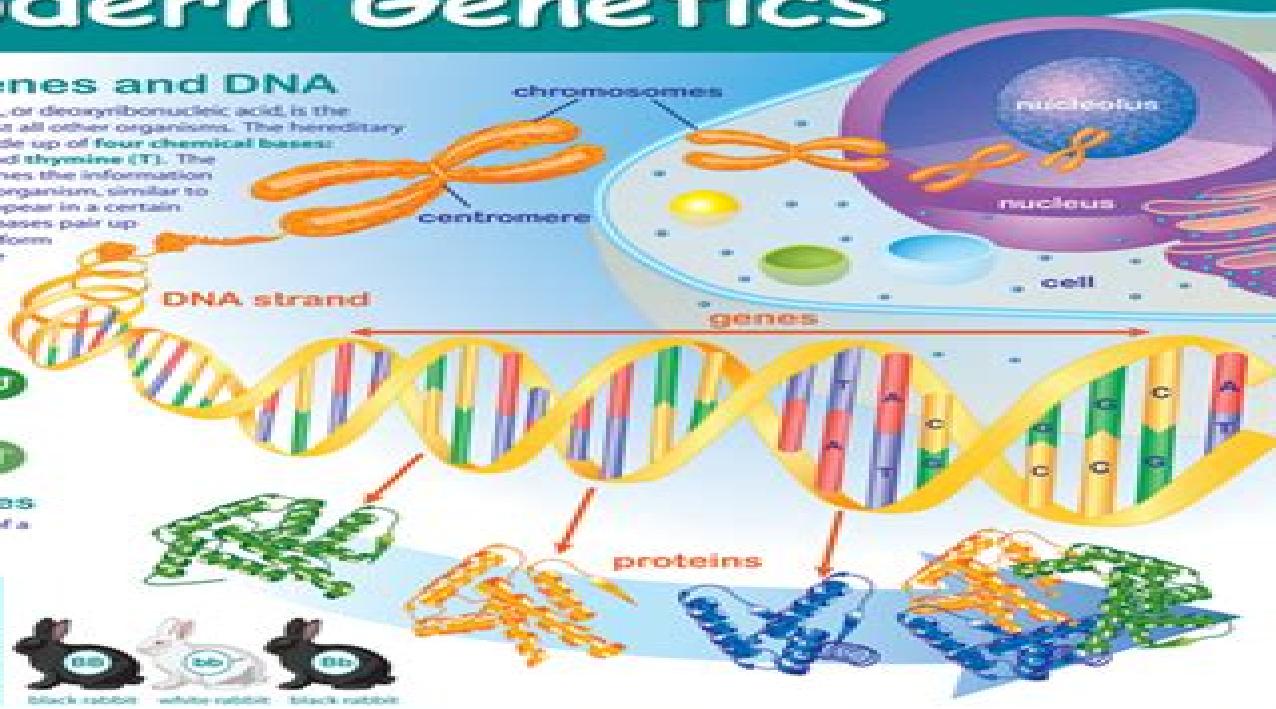

Chromosomes are made up of DNA. DNA, or deoxyribonucleic acid, is the hereditary material in humans and almost all other organisms. The hereditary information in DNA is stored as a code made up of four chemical bases: adenine (A), guanine (G), cytosine (C), and thymine (T). The order, or sequence, of these bases determines the information available for building and maintaining an organism, similar to the way in which letters of the alphabet appear in a certain order to form words and sentences. DNA bases pair up with each other: A with T and C with G, to form units called base pairs. Each chromosome contains thousands of genes. A gene is a section of a DNA strand that is made up of a series of bases which contains the information for cells to make one specific protein.

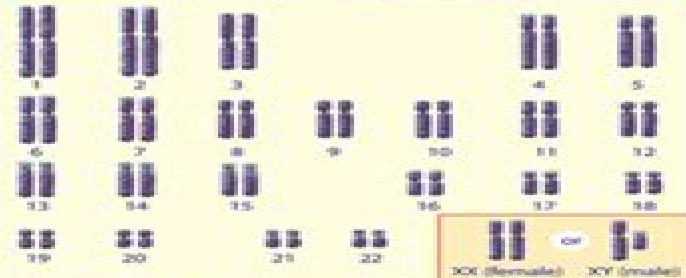

## Phenotypes and Genotypes

A phenotype is the physical appearance of a particular organism. The genotype is the genetic make-up of a particular organism.

Phenotype	Genotype
Black fur	BB
Black fur	Bb
White fur	bb

## Human Karyotype

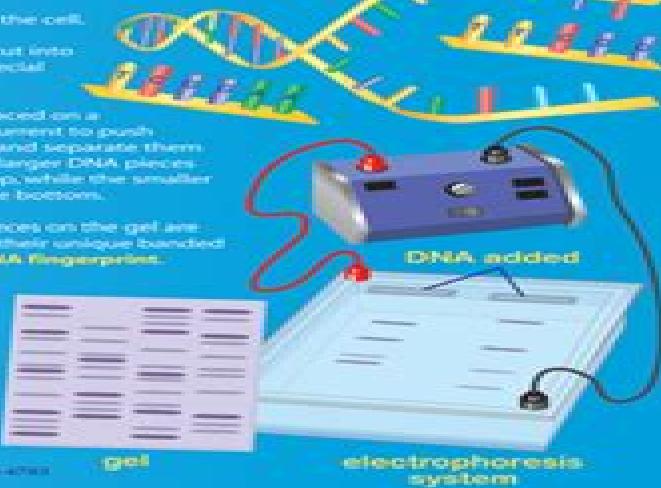

A karyotype is a picture of the complete set of chromosomes in a cell. Scientists examine a karyotype to identify and evaluate the size, shape, and number of chromosomes in a human cell. Extra, missing, or abnormal positions of chromosome pieces can cause problems with a person's growth, development, and body functions. A normal human male karyotype is represented as 46,XY and a normal female karyotype is represented as 46,XX. Individuals with chromosomal disorders include Down Syndrome (47, XY or 45, X) and Turner's Syndrome (45, X) among others.

## DNA Fingerprinting

Each person has a unique set of DNA. Because of this uniqueness, it can be used to produce a genetic fingerprint known as DNA fingerprinting. It is a method used by scientists to solve crimes, determine familial relationships or to track hereditary diseases.

1. DNA is extracted from the cell.
2. The extracted DNA is cut into smaller pieces with special enzymes.
3. The DNA pieces are placed on a gel that uses electric current to push them through the gel and separate them according to size. The larger DNA pieces remain closer to the top, while the smaller ones move towards the bottom.
4. The separated DNA pieces on the gel are then stained to reveal their unique banded pattern known as a DNA fingerprint.

H. WADDINGTON, 2017-07-25 Excerpt from An Introduction to Modern Genetics Few biologists will doubt that heredity the subject matter of genetics is one of the important problems of biology Indeed when Mendel's results were rediscovered in 1900 and the new science of genetics got under way it appeared to some authors that a new era was dawning in biological thought But in the years that followed it often seemed that the high hopes which had been entertained were becoming dissipated in a morass of numerical elaborations on the hackneyed theme of Mendelian segregation Genetics was in danger of being considered by other biologists as a world of its own devoted to following the comings and goings of genes whose relevance to other biological phenomena though incontrovertible in general theory could rarely be stated in detail and in particular About the Publisher Forgotten Books publishes hundreds of thousands of rare and classic books Find more at [www.forgottenbooks.com](http://www.forgottenbooks.com) This book is a reproduction of an important historical work Forgotten Books uses state of the art technology to digitally reconstruct the work preserving the original format whilst repairing imperfections present in the aged copy In rare cases an imperfection in the original such as a blemish or missing page may be replicated in our edition We do however repair the vast majority of imperfections
