Modern Methods Of Speech Processing:

Modern Methods of Speech Processing Ravi Ramachandran, Richard Mammone, 1995-10-31 The term speech processing refers to the scientific discipline concerned with the analysis and processing of speech signals for getting the best benefit in various practical scenarios. These different practical scenarios correspond to a large variety of applications of speech processing research. Examples of some applications include enhancement, coding, synthesis, recognition and speaker recognition. A very rapid growth particularly during the past ten years has resulted due to the efforts of many leading scientists. The ideal aim is to develop algorithms for a certain task that maximize performance are computationally feasible and are robust to a wide class of conditions. The purpose of this book is to provide a cohesive collection of articles that describe recent advances in various branches of speech processing. The main focus is in describing specific research directions through a detailed analysis and review of both the theoretical and practical settings. The intended audience includes graduate students who are embarking on speech research as well as the experienced researcher already working in the field. For graduate students taking a course this book serves as a supplement to the course material. As the student focuses on a particular topic the corresponding set of articles in this book will serve as an initiation through exposure to research issues and by providing an extensive reference list to commence a literature survey. Experienced researchers can utilize this book as a reference guide and can expand their horizons in this rather broad area.

Contemporary Methods for Speech Parameterization Todor Ganchev, 2011-08-10 Contemporary Methods for Speech Parameterization offers a general view of short time cepstrum based speech

parameterization and provides a common ground for further in depth studies on the subject Specifically it offers a comprehensive description comparative analysis and empirical performance evaluation of eleven contemporary speech parameterization methods which compute short time cepstrum based speech features Among these are five discrete wavelet packet transform DWPT based six discrete Fourier transform DFT based speech features and some of their variants which have been used on the speech recognition speaker recognition and other related speech processing tasks The main similarities and differences in their computation are discussed and empirical results from performance evaluation in common experimental conditions are presented The recognition accuracy obtained on the monophone recognition continuous speech recognition and speaker recognition tasks is contrasted against the one obtained for the well known and widely used Mel Frequency Cepstral Coefficients MFCC It is shown that many of these methods lead to speech features that do offer competitive performance on a certain speech processing setup when compared to the venerable MFCC The last does not target the promotion of certain speech features but instead aims to enhance the common understanding about the advantages and disadvantages of the various speech parameterization techniques available today and to provide the basis for selection of an appropriate speech parameterization in each particular case

Speech Processing in Modern Communication Israel Cohen,Jacob Benesty,Sharon Gannot,2009-12-18 Modern communication devices such as mobile phones teleconferencing systems VoIP etc are often used in noisy and reverberant environments Therefore signals picked up by the microphones from telecommunication devices contain not only the desired near end speech signal but also interferences such as the background noise far end echoes produced by the loudspeaker and reverberations of the desired source These interferences degrade the fidelity and intelligibility of the near end speech in human to human telecommunications and decrease the performance of human to machine interfaces i e automatic speech recognition systems The proposed book deals with the fundamental challenges of speech processing in modern communication including speech enhancement interference suppression acoustic echo cancellation relative transfer function identification source localization dereverberation and

beamforming in reverberant environments Enhancement of speech signals is necessary whenever the source signal is corrupted by noise In highly non stationary noise environments noise transients and interferences may be extremely annoying Acoustic echo cancellation is used to eliminate the acoustic coupling between the loudspeaker and the microphone of a communication device Identification of the relative transfer function between sensors in response to a desired speech signal enables to derive a reference noise signal for suppressing directional or coherent noise sources Source localization dereverberation and beamforming in reverberant environments further enable to increase the intelligibility of the near end speech signal *2000 IEEE International Conference on Acoustics, Speech, and Signal Processing*, 2000 *First IEEE International Conference on Cognitive Informatics* Yingxu Wang, Ronald H.
