[High-Performance Networks for Multimedia Applications](#) A. Danthine,1999 High Performance Networks for

Multimedia Applications presents the latest research on the services and protocols for networks providing the communication support for distributed multimedia applications. The need for end to end QoS for these multimedia applications is raising the stakes for a powerful shaping and scheduling in the network adapter. It is also creating a need for new services at the ATM layer CBR and VBR being augmented by UBR ABR and GFR which have to be evaluated in the TCP IP environment of today and tomorrow. With the pressure of all the new technologies available today the backbone architecture needs to be revisited and the success of the TCP IP must not eliminate the possibility of adding a native ATM access to it. Most of the research in communication services such as IntServ DiffServ and Native ATM is driven by the requirements of multimedia systems and this book illustrates the new emphasis by bringing telecommunication and computer communication experts together with application designers. This is particularly true for the security issues also addressed here. Last but not least modeling techniques and mathematical models are essential to assess the performance of the networks to be built and to evaluate next century scenarios unachievable by a simple scaling of today's solutions. High Performance Networks for Multimedia Applications is a collection of high quality research papers and the in depth treatment of the subjects provides interesting and innovative solutions. It is an essential reference for telecommunication and computer experts and QoS based application designers. It is also a comprehensive text for graduate students in high performance networks and multimedia applications.

**Multimedia Tools and Applications** Borko Furht, 2011-09-30

Multimedia computing has emerged in the last few years as a major area of research. Multimedia computer systems have opened a wide range of applications by combining a variety of information sources such as voice, graphics, animation, images, audio, and full motion video. Looking at the big picture, multimedia can be viewed as the merging of three industries: the computer, communications, and broadcasting industries. Research and development efforts in multimedia computing can be divided into two areas. As the first area of research, much effort has been centered on the stand alone multimedia workstation and associated software systems and tools such as music composition, computer aided education and training, and interactive video. However, the combination of multimedia computing with distributed systems offers even greater potential. New applications based on distributed multimedia systems include multimedia information systems, collaborative and videoconferencing systems, on demand multimedia services, and distance learning.

**Multimedia Tools and Applications** is one of two volumes published by Kluwer, both of which provide a broad introduction to this fast moving area. This book covers selected tools applied in multimedia systems and key multimedia applications. Topics presented include multimedia application development techniques, techniques for content based manipulation of image databases, techniques for selection and dissemination of digital video, and tools for digital video segmentation. Selected key applications described in the book include multimedia news services, multimedia courseware and training, interactive television systems, digital video libraries, multimedia messaging systems, and interactive multimedia publishing systems. The second book, **Multimedia Systems**, and

Techniques covers fundamental concepts and techniques used in multimedia systems The topics include multimedia objects and related models multimedia compression techniques and standards multimedia interfaces multimedia storage techniques multimedia communication and networking multimedia synchronization techniques multimedia information systems scheduling in multimedia systems and video indexing and retrieval techniques Multimedia Tools and Applications along with its companion volume is intended for anyone involved in multimedia system design and applications and can be used as a textbook for advanced courses on multimedia

**Computed Synchronization for Multimedia Applications** Charles B.

Owen,Fillia Makedon,2013-04-17 Multimedia is changing the design of database and information retrieval systems The accumulation of audio image and video content is of little use in these systems if the content cannot be retrieved on demand a critical requirement that has led to the development of new technologies for the analysis and indexing of media data In turn these technologies seek to derive information or features from a data type that can facilitate rapid retrieval efficient compression and logical presentation of the data Significant work that has not been addressed however is the benefits of analyzing more than one data type simultaneously Computed Synchronization for Multimedia Applications presents a new framework for the simultaneous analysis of multiple media data objects The primary benefit of this analysis is computed synchronization a temporal and spatial alignment of multiple media objects Computed Synchronization for Multimedia Applications also presents several specific applications and a general structure for the solution of computed synchronization problems The applications demonstrate the use of this structure Two applications in particular are described in detail the alignment of text to speech audio and the alignment of simultaneous English language translations of ancient texts Many additional applications are discussed as future uses of the technology Computed Synchronization for Multimedia Applications is useful to researchers students and developers seeking to apply computed synchronization in many fields It is also suitable as a reference for a graduate level course in multimedia data retrieval
