Multiparadigm Programming In Leda:

Multiparadigm Programming in Leda Timothy Budd,1995 Author and noted computer scientist Timothy Budd has been at the cutting edge of multiparadigm programming research He has developed a single programming language Leda which can be used to illustrate the benefits of four different programming paradigms Using Leda Budd shows in his new book how the unique features of each paradigm can be learned and applied simultaneously through one multiparadigm tool

LacEDAemon Rajeev K. Pandey,1998 Multiparadigm programming languages are a recent development in the realm of programming languages A multiparadigm programming language allows the use of multiple differing programming paradigms without departing from a single unified linguistic framework Multiparadigm programming languages are claimed to have benefits to both pedagogy and complex application creation The beneficial claims of multiparadigm languages have yet to be validated The availability of a programming environment would encourage and expedite academic and industrial validation Creating a programming environment is considered an extremely labor intensive activity Further complications arise from the fact that programming environment creation is an experimental activity the component mix that best expedites program development in a new programming language cannot be predicted in advance As a result few new languages are ever verified in the context of a supportive programming environment Leda a unique programming language that includes the functional imperative logic and object oriented paradigms is at this juncture This thesis describes the structure of an environment framework that allows for experimental study of the necessary components of a multiparadigm programming language environment New tools and techniques as well as changes to traditional tools and techniques are required to allow programmers to abstract effectively across paradigms This research examines the topic by creating LacEDAemon a testbed programming environment for the multiparadigm programming language Leda within the framework of a variety of integrated cohesive tools LacEDAemon relies on a hypertool based toolkit integration framework architecture that affords both loose and tight control integration as well as data integration using existing off the shelf tools written in a variety of programming languages Along with demonstrating the viability of hypertool integration as a low cost approach for constructing programming environments LacEDAemon provides a vehicle for determining an effective multiparadigm programming toolset studying multiparadigm program design conducting studies of multiparadigm program visualization exploring different strategies for software reuse and examining the merits of conducting all programming activity within the database centered environment approach This environment also provides support for investigations in the areas of multiparadigm algorithms multiparadigm software metrics and multiparadigm program comprehension Various techniques for evaluating integrated environments are also applied to LacEDAemon   *Multiparadigm Data Structures in Leda* Timothy Budd,1994 Multiparadigm programming is a term used to describe a style of software development that makes use of facilities originally designed in support of a number of different programming language paradigms In this paper we illustrate

our conception of multiparadigm programming by describing how various data structures can be implemented in the programming language Leda Leda is a strongly typed compiled multiparadigm programming language that we have been developing over the past several years Our exposition serves both to illustrate the idea of multiparadigm programming and to describe the features of the language Leda   **Electra** Nabil M. Zamel,1994 Multiparadigm languages are languages that are designed to support more than one style of programming Leda is a strongly typed multiparadigm programming language that supports imperative functional object oriented and logic programming The constraint programming paradigm is a declarative style of programming where the programmer is able to state relationships among some entities and expect the system to maintain the validity of these relationships throughout program execution The system accomplishes this either by invoking user defined fixes that impose rigid rules governing the evolution of the entities or by finding suitable values to be assigned to the constrained entities without violating any active constraint Constraints due to their declarative semantics are suitable for the direct mapping of the characteristics of a number of mechanisms including consistency checks constraint directed search and constraint enforced reevaluation among others This makes constraint languages the most appropriate languages for the implementation of a large number of applications such as scheduling planning resource allocation simulation and graphical user interfaces The semantics of constraints cannot be easily emulated by other constructs in the paradigms that are offered by the language Leda However the constraint paradigm does not provide any general control constructs The lack of general control constructs impedes this paradigm s ability to naturally express a large number of problems This dissertation presents the language Electra which integrates the constraint paradigm into the language Leda by creating a unified construct that provides the ability to express the conventional semantics of constraints with some extensions Due to the flexibility of this construct the programmer is given the choice of either stating how a constraint is to be satisfied or delegating that task to the constraint satisfier The concept of providing the programmer with the ability to express system maintained relations which is the basic characteristic of constraints provided a motivation for enhancing other paradigms with similar abilities The functional paradigm is extended by adding to it the mechanism of condition based dispatching which is similar to argument pattern matching The object oriented paradigm is extended by allowing feature exclusion which is a form of inheritance exception This dissertation claims that the integration provided by the language Electra will enable Leda programmers to reap the benefits of the paradigm of constraints while overcoming its limitations
