Exploiting Structure in Multiobjective Optimization and Optimal Control Sebastian Peitz, 2017 Multiobjective optimization plays an increasingly important role in modern applications where

several criteria are often of equal importance The task in multiobjective optimization and multiobjective optimal control is therefore to compute the set of optimal compromises the Pareto set between the conflicting objectives Since the Pareto set generally consists of an infinite number of solutions the computational effort can quickly become challenging This is even more the case when many problems have to be solved when the number of objectives is high or when the objectives are costly to evaluate Consequently this thesis is devoted to the identification and exploitation of structure and to the development of efficient algorithms for solving problems with additional parameters with a high number of objectives or with PDE constraints In the first part predictor corrector methods are extended to entire Pareto sets When certain smoothness assumptions are satisfied then the set of parameter dependent Pareto sets possesses additional structure which can be exploited The resulting algorithm is applied to an example from autonomous driving In the second part the hierarchical structure of Pareto sets is investigated When considering a subset of the objectives the resulting solution is a subset of the Pareto set of the original problem This way the skeleton of a Pareto set can be computed significantly faster which is demonstrated using an example from industrial laundries In the third part PDE constrained multiobjective optimal control problems are addressed by reduced order modeling methods The model reduction introduces an error in both the function values and their gradients which has to be taken into account in the development of algorithms Different Approaches are coupled with reduced order modeling Convergence results are presented eng

Optimization and Multiobjective Control of Time-Discrete Systems Dmitrii Lozovanu, 2009-04-21 Richard Bellmann developed a theory of dynamic programming which is for many reasons still in the center of great interest The authors present a new approach in the field of the optimization and multi objective control of time discrete systems which is closely related to the work of Richard Bellmann They develop their own concept and their extension to the optimization and multi objective control of time discrete systems as well as to dynamic networks and multilayered structures are very stimulating for further research Different perspectives of discrete control and optimal dynamic flow problems on networks are treated and characterized Together with the algorithmic solutions a framework of multi objective control problems is derived The conclusion with a real world example underlines the necessity and importance of their theoretic framework As they come back to the classical Bellmann concept of dynamic programming they stress and honor his basic concept without debase their own work

Multiobjective Decision Making Vira Chankong, Yacov Y. Haimes, 1983 **Large Scale Systems: Theory and Applications** 1989 K. Reinisch, M. Thoma, 1990-06-08 The papers present new trends on the development of theory and applications in the field of large scale systems analysis planning and control The issues discussed are proving to be of great importance as systems of growing complexity are found in all fields of human activities often developed by economic organizational and technological effects The papers are divided into three main areas of interest
