A REVIEW OF PALLADIUM AND PALLADIUM ALLOYS

The second International Symposium on Metal-Hydrogen Systems, Fundamentals and Applications, was held from the 2nd to 7th September 1990, in Banff, Canada. This survey outlines a selection of the papers presented at the conference on work involving hydrogen interaction with the platinum group metals.

The chairman of the organising committee, Professor F. D. Manchester, opened the conference by commenting on the many new developments that have arisen within the field of metal-hydrogen studies since the 1988 Symposium in Stuttgart – perhaps most notably as a consequence of the “cold fusion” controversy which has brought many aspects of metal-hydrogen research to world attention.

Cold Fusion

As a reflection of this particular area of interest, a significant proportion of the papers were concerned with various aspects of cold fusion.

A group from Japan, K. Tsachiya (Tokyo National College of Technology), K. Ohashi (Tamagawa University), Y. H. Ohashi and M. Fukuchi (Keio University) approached the question by estimating the nearest neighbour distance between two deuterium atoms in a f.c.c. palladium lattice using the Schrödinger equation, taking into account the electronic screening cloud. They estimated the D-D distance to be 0.66 Å, which is smaller than the molecular value of 0.74 Å.

Several researchers tackled the question of electrolytically induced cold fusion by using various techniques to determine the maximum possible deuterium content of palladium.

An in-situ X-ray diffraction observation of a palladium foil cathode during electrolysis of heavy water solution, particularly concentrating on the nature of the transformation into the deuteride (β -PdD₂) phase, was reported by T. Yamamoto, T. Oka and R. Taniguchi from the Osaka Prefectural Radiation Research Institute,

Japan. The lattice constants observed were converted into deuterium concentrations and potentials by the use of known data on the phase relation. A maximum deuterium content, expressed as an atomic ratio, D:Pd = 0.80 at room temperature was reported.

A limiting concentration of D:Pd = 0.78 was reported by P. R. Stonadge, M. J. Benham, S. M. Bennington, J. P. A. Fairclough and D. K. Ross from Birmingham University, who used time-of-flight neutron diffraction and concurrent resistivity measurements to investigate electrochemical charging of palladium rods.

On a positive note, an alternative approach taken by researchers H. Uchida, Y. Matsumura, T. Hayashi and M. Kawachi (Tokai University, Japan) was the use of GM- and NaI-scintillation counters to measure γ - or X-ray emissions from an electrolytically deuterided palladium electrode. They reported 20 to 35 per cent excess radiation during deuteriding of palladium wire in KOD solution at greater than 600 mA/cm² and 20 V but no excess radiation on hydriding of palladium in KOH at similar current and voltage input.

Negative results were again however reported by Y.-Q. Lei, Y.-L. Chen, D.-L. Sun, J. Wu and Q.-D. Wang from Zhejiang University, China; no excess heat or γ -ray emission higher than background were detected during a 290 hour electrolysis of deuterium oxide using a palladium bar cathode.

The subject of cold fusion was raised in debate again at the conclusion of the conference. Despite the huge number of negative results, and apparent irreproducibility of the effect, some delegates cautioned against complete dismissal of the phenomenon.
