Metals At High Temperatures:

Materials for High Temperature Engineering Applications G.W. Meetham, M.H. Van de Voorde, 2000-04-14 This concise survey describes the requirements on materials operating in high temperature environments and the processes increasing temperature capability of metals ceramics and composites The major part deals with the applicable materials and their specific properties One chapter is devoted to coatings The book is written for engineering and science students researchers and managers in industries *High-temperature Oxidation of Metals* Per Kofstad, 1966 **Metals At High Temperatures** Vladislav E. Zinov'ev, 1990-06-01 **Metals at High Temperatures** Frances Hurd Clark, 1950

Engineer's Guide to High-temperature Materials Francis Jacob Clauss, 1969 **Thermal Conductivity of Metals at High Temperatures** Paul H. Sidles, G. C. Danielson, 1951 **High-temperature Property Data** Michael F. Rothman, ASM International, 1988 This volume organizes information by alloy so that pertinent data can be found easily Physical and mechanical properties from room temperature to temperatures in excess of 100 C are shown graphically or in tabular form All data is thoroughly referenced Now high temperature property data can be found in one complete reference Over 200 alloys are organized by AISI number into 11 major sections Irons Carbon Steels Alloy Steels ASTM Steels Low Alloy Constructional Steels Ultra High Strength Steels Tool Steels Maraging Steels Wrought Stainless Steels Heat Resistant Casting Alloys and Wrought Iron Nickel Alloys and Iron Nickel Superalloys Each alloy record lists the designation specifications UNS number composition product forms and a comment on the high temperature properties and applications Data is then given for physical properties such as density specific heat thermal conductivity thermal expansion electrical conductivity Poissons ratio moduli of elasticity and rigidity etc Mechanical properties follow and include tensile properties shearing and bearing properties impact properties creep stress rupture and stress relaxation and fatigue properties The last part of the alloy record gives other effects of temperature such as hot hardness corrosion and growth **Properties of Metals at Elevated Temperatures** George V. Smith, 1950 [Fatigue and Durability of Metals at High Temperatures](#) S. S. Manson, Gary R. Halford, 2009 From concept to application this book describes the method of strain range partitioning for analyzing time dependent fatigue Creep time dependent deformation is first introduced for monotonic and cyclic loading Multiple chapters then discuss strain range partitioning in details for multi axial loading conditions and how different loading permutations can lead to different micro mechanistic effects Notably the total strain method of strain range partitioning SRP is described which is a methodology that sees use in several industries Examples from aerospace illustrate applications and methods for predicting time dependent metal fatigue are critiqued **Carbon at High Temperatures** Alexander Savvatimskiy, 2015-09-07 This book deals with the properties and behavior of carbon at high temperatures It presents new methods and new ways to obtain the liquid phase of carbon Melting of graphite and the properties of liquid carbon are presented under stationary heat and pulse methods Metal like properties of molten graphite at high initial density are

indicated A new possible transition of liquid carbon from metal to nonmetal behavior much above the melting point is mentioned Methodical questions of pulse heating in particular the role of pinch pressure in receiving a liquid state of carbon are discussed The reader finds evidence about the necessity of applying high pressure higher than 100 bar to melt graphite melting temperature 4800 K The reader can verify the advantage of volume pulse electrical heating before surface laser heating to study the physical properties of carbon including enthalpy heat capacity electrical resistivity and temperature The advantages of fast heating of graphite by pulsed electric current during a few microseconds are shown The data obtained for the heat capacity of liquid carbon under constant pressure and constant volume were used to estimate the behavior at temperatures much higher 5000 K *High-Temperature Corrosion and Materials Applications* George Y. Lai, 2007-01-01 George Lai's 1990 book *High Temperature Corrosion of Engineering Alloys* is recognized as authoritative and is frequently consulted and often cited by those in the industry His new book almost double in size with seven more chapters addresses the new concerns new technologies and new materials available for those engaged in high temperature applications As we strive for energy efficiency the realm of high temperature environments is expanding and the need for information on high temperature materials applications was never greater In addition to extensive expansion on most of the content of the original book new topics include erosion and erosion corrosion low NO_x combustion in coal fired boilers fluidized bed combustion and the special demands of waste to energy boilers waste incinerators and black liquor recovery boilers in the pulp and paper industry The corrosion induced by liquid metals is discussed and protection options are presented

High-Temperature Behavior of Metals Elisabetta Gariboldi, Stefano Spigarelli, 2021-10-18 The design of new alloys or metal based composites as well as the optimization of any of the processes involved in high temperature deformation must take into account the characterization and or modeling of the high temperature mechanical responses of the material This is not a new concept Nevertheless there is still much to be done both in terms of data accumulation specifically for innovative materials and in terms of material modeling for proper process management specifically when innovative deformation processes including more complex time and temperature combinations are considered Microstructural changes induced by the process can also severely affect both the further processability of the material as well as its final properties structural or functional Similar considerations hold in the case of conventional or innovative metallic materials where high temperature deformation occurs due to high temperature service of the structural components Thus knowledge of the effects on the initial microstructure as well as the microstructural changes taking place during in service deformation are of paramount importance for the optimization of high temperature structural alloys This book *High Temperature Behavior of Metals* contains contributions dealing with a wide range of metallic materials illustrating some of the most recent and interesting advances in the field of the high temperature structural behavior of metallic materials *Thermal Conductivity of Metals at High Temperatures* Martin Fuller Angell, 1912 *High Temperature Strain of Metals and Alloys* Valim Levitin, 2006-05-12

Creep and fatigue are the most prevalent causes of rupture in superalloys which are important materials for industrial usage e g in engines and turbine blades in aerospace or in energy producing industries As temperature increases atom mobility becomes appreciable affecting a number of metal and alloy properties It is thus vital to find new characterization methods that allow an understanding of the fundamental physics of creep in these materials as well as in pure metals Here the author shows how new in situ X ray investigations and transmission electron microscope studies lead to novel explanations of high temperature deformation and creep in pure metals solid solutions and superalloys This unique approach is the first to find unequivocal and quantitative expressions for the macroscopic deformation rate by means of three groups of parameters substructural characteristics physical material constants and external conditions Creep strength of the studied up to date single crystal superalloys is greatly increased over conventional polycrystalline superalloys From the contents Macroscopic characteristics of strain at high temperatures Experimental equipment and technique of in situ X ray investigations Experimental data and structural parameters in deformed metals Subboundaries as dislocation sources and obstacles The physical mechanism of creep and the quantitative structural model Simulation of the parameters evolution System of differential equations High temperature deformation of industrial superalloys Single crystals of superalloys Effect of composition orientation and temperature on properties Creep of some refractory metals For materials scientists solid state physicists solid state chemists researchers and practitioners from industry sectors including metallurgical mechanical chemical and structural engineers
