## **Metapopulation Biology Ecology Genetics And Evolution:**

**Metapopulation Biology** Ilkka Hanski, Michael E. Gilpin, 1997 Habitat destruction has left many landscapes increasingly fragmented. These isolated populations or metapopulations are in a constant state of change, growing, shrinking, disappearing, and reappearing. This unique volume brings together an international team of ecologists, geneticists, and evolutionary biologists who provide a comprehensive review of metapopulations. This book will provide fundamental reading for anyone studying the spatial dynamics of populations. This book is an essential reference for anyone who is interested in conservation and population dynamics. Key Features: Essential for biologists interested in spatial population dynamics. Serves as a valuable reference to conservationists. Covers both the principal theories and field studies. Reviews the ecology, genetics, and evolution of metapopulations.

**Ecology, Genetics and Evolution of Metapopulations** Ilkka A. Hanski, Oscar E. Gaggiotti, 2004-02-26 Spatial dynamics landscape population *Ecology, Genetics and Evolution of Metapopulations* Ilkka A. (University of Helsinki) Hanski, 2004-02

*Multitrophic Level Interactions* Teja Tscharntke, Bradford A. Hawkins, 2002-03-21 The multitrophic level approach to ecology addresses the complexity of food webs much more realistically than the traditional focus on simple systems and interactions. Only in the last few decades have ecologists become interested in the nature of more complex systems including tritrophic interactions between plants, herbivores, and natural enemies. Plants may directly influence the behaviour of their herbivores, natural enemies, ecological interactions between two species are often indirectly mediated by a third species. Landscape structure directly affects local tritrophic interactions and below ground food webs are vital to above ground organisms. The relative importance of top down effects, control by predators and bottom up effects, control by resources must also be determined. These interactions are explored in this exciting volume by expert researchers from a variety of ecological fields. This book provides a much needed synthesis of multitrophic level interactions and serves as a guide for future research for ecologists of all descriptions.

**Marine Metapopulations** Jacob P. Kritzer, Peter F. Sale, 2010-07-20 Technological improvements have greatly increased the ability of marine scientists to collect and analyze data over large spatial scales and the resultant insights attainable from interpreting those data vastly increase understanding of population dynamics, evolution, and biogeography. *Marine Metapopulations* provides a synthesis of existing information and understanding and frames the most important future directions and issues. First book to systematically apply metapopulation theory directly to marine systems. Contributions from leading international ecologists and fisheries biologists. Perspectives on a broad array of marine organisms and ecosystems from coastal estuaries to shallow reefs to deep sea hydrothermal vents. Critical science for improved management of marine resources. Paves the way for future research on large scale spatial ecology of marine systems.

**Evolutionary Conservation Biology** Régis Ferrière, Ulf Dieckmann, Denis Couvet, 2004-06-10 As anthropogenic environmental changes spread and intensify across the planet, conservation biologists have to analyze dynamics at large spatial and temporal scales. Ecological and evolutionary processes are then closely

intertwined In particular evolutionary responses to anthropogenic environmental change can be so fast and pronounced that conservation biology can no longer afford to ignore them To tackle this challenge areas of conservation biology that are disparate ought to be integrated into a unified framework Bringing together conservation genetics demography and ecology this book introduces evolutionary conservation biology as an integrative approach to managing species in conjunction with ecological interactions and evolutionary processes Which characteristics of species and which features of environmental change foster or hinder evolutionary responses in ecological systems How do such responses affect population viability community dynamics and ecosystem functioning Under which conditions will evolutionary responses ameliorate rather than worsen the impact of environmental change

**A Resource-Based Habitat View for Conservation** Roger L. H.

Dennis,2012-04-10 Winner of the Marsh Book of the Year Award 2012 by the British Ecological Society In A Resource Based Habitat View for Conservation Roger Dennis introduces a novel approach to the understanding of habitats based on resources and conditions required by organisms and their access to them a quantum shift from simplistic and ineffectual notions of habitats as vegetation units or biotopes In drawing attention to what organisms actually use and need in landscapes it focuses on resource composition structure and connectedness all of which describe habitat quality and underpin landscape heterogeneity This contrasts with the current bipolar view of landscapes made up of habitat patches and empty matrix but illustrates how such a metapopulation approach of isolated patchworks can grow by adopting the new habitat viewpoint The book explores principles underlying this new definition of habitat and the impact of habitat components on populations species distributions geographical ranges and range changes with a view to conserving resources in landscapes for whole communities It does this using the example of butterflies the most alluring of insects flagship organisms and key indicators of environmental health in the British Isles where they have been studied most intensively The book forms essential reading for students researchers and practitioners in ecology and conservation particularly those concerned with managing sites and landscapes for wildlife

The Ecological Consequences of Environmental Heterogeneity British Ecological Society.

Symposium,2000-08 The last decade has seen countless advances in the measurement and interpretation of the impacts of environmental heterogeneity upon organisms and ecological processes Progress has been made at a variety of scales of organisation Following a Symposium on Ecological Consequences of Environmental Heterogeneity a team of international experts has collaborated to produce this volume It discusses the effects of environmental heterogeneity the effects of spatial and temporal heterogeneity on individuals populations communities and biodiversity and the management and conservation implications of environmental heterogeneity This book will prove to be an invaluable reference work not only to advanced students but also established researchers working in the field

Insect Populations In theory and in practice Jack P.

Dempster,Ian F.G. McLean,2012-12-06 Insects are by far the largest group of animals on Earth with over a million described species and they occupy a wide range of ecological niches they may be herbivores predators parasites or decomposers Some

are of particular economic importance as pests of agriculture and forestry as vectors of animal and human disease or as species of interest to wildlife conservation. Thus an understanding of the processes determining their numbers is of considerable practical value. Entomologists have played a leading role in developing a theoretical basis to Population Ecology but we still do not have adequate experimental and observational proof for many of the theoretical ideas that have been proposed. As a result the subject has been beset with arguments for more than 50 years. This volume attempts to reconcile some of these controversies while also reviewing the current state of our knowledge. The editors have drawn together an international list of contributors whose views reflect a range of opinions on how natural populations are stabilised. They have succeeded in producing a book that both covers the main alternative views in population theory and contains some of the best recent field studies of insect populations. This Royal Entomological Society Symposium volume will be of great interest to all entomologists and ecologists particularly those who wish to know more about Population Dynamics. **Demography, Migration, and Metapopulation Structure of Pond Breeding Salamanders** Peter Cornell Jr Trenham, 1998

Modeling Spatiotemporal Dynamics in Ecology Jordi Bascompte, Ricard V. Sole, 1998. Throughout its history ecology has largely been a descriptive science. Scientists are in need of a theoretical framework that will assist in the understanding of observed patterns and will serve as a predictive tool. Since ecological systems are dynamic and spatially extended it is particularly important to understand the processes underlying spatiotemporal patterns. This book reviews one of the newest and most important areas of theoretical ecology the study of spatiotemporal dynamics by means of a spatially explicit approximation that allows the investigation of the effects of real space. Reproductive Biology of Invertebrates K. G. Adiyodi, Rita G. Adiyodi, 1983. **Biodiversity and Insect Pests** Geoff M. Gurr, Stephen D. Wratten, William E.

Snyder, 2012-05-29. Biodiversity offers great potential for managing insect pests. It provides resistance genes and anti insect compounds a huge range of predatory and parasitic natural enemies of pests and community ecology level effects operating at the local and landscape scales to check pest build up. This book brings together world leaders in theoretical methodological and applied aspects to provide a comprehensive treatment of this fast moving field. Chapter authors from Europe, Asia, Africa, Australasia and the Americas ensure a truly international scope. Topics range from scientific principles, innovative research methods, ecological economics and effective communication to farmers as well as case studies of successful use of biodiversity based pest management some of which extend over millions of hectares or are enshrined as government policy. Written to be accessible to advanced undergraduates whilst also stimulating the seasoned researcher this work will help unlock the power of biodiversity to deliver sustainable insect pest management. Visit [www.wiley.com/go/gurr/biodiversity](http://www.wiley.com/go/gurr/biodiversity) to access the artwork from the book. Canadian Journal of Zoology, 2007. Ecology, 1998. Proceedings, 2006. Conservation Biology Fred Van Dyke, 2003. This first edition takes a contemporary interdisciplinary approach to conservation biology and features vivid illustrations, an engaging writing style and succinct coverage of the key principles.

governing conservation Conservation Biology focuses on the preservation of worldwide biodiversity through the conservation of habitats and restoration of ecosystems This text is designed for undergraduates at the junior and senior level especially those with strong backgrounds in biology It assumes a basic knowledge of cellular organismal and ecosystem functions and characteristics complemented by a basic understanding of reproductive biology including the characteristics of DNA and its replication and mutation It is designed for a one semester course **Speciation in Marine Systems** Irma Olguín,2003 It is generally believed that the formation of new species requires substantial accumulation of genetic differentiation across the genome and for this to occur the range of the ancestral species should have been subdivided by a physical barrier to gene flow However in the ocean despite the high dispersal potential of most marine species and the lack of obvious barriers to gene flow the rate of speciation is high To understand the speciation process in the sea fertilization assays and allozyme data were used to examine the relationship between genetic differentiation and reproductive isolation in a broadcast spawning high dispersal species the sea urchin *Arbacia incisa* This species has a wide distribution range in the eastern Pacific that is subdivided by a land barrier the Baja California peninsula  $F_{ST}$  and Nei's genetic distance estimates indicated a relatively low genetic structuring of populations despite geographic subdivision The largest genetic distance between locations across the peninsula was  $D = 0.148$  indicating that populations on opposite sides of the land barrier are not significantly more differentiated than local populations of reference species  $D = 0.031$  *Choice* ,2001 [Dynamics and Persistence of Spatially Structured Populations](#) Christine Lorraine Ray,1997

## **Metapopulation Biology Ecology Genetics And Evolution** Book Review: Unveiling the Power of Words

In a world driven by information and connectivity, the power of words has never been more evident than ever. They have the ability to inspire, provoke, and ignite change. Such is the essence of the book **Metapopulation Biology Ecology Genetics And Evolution**, a literary masterpiece that delves deep into the significance of words and their impact on our lives. Written by a renowned author, this captivating work takes readers on a transformative journey, unraveling the secrets and potential behind every word. In this review, we will explore the book's key themes, examine its writing style, and analyze its overall impact on readers.
