By X-ray diffraction and neutron diffraction using the isotopic substitution method, the partial structure factors S_{FeFe} , S_{FeB} , and S_{BB} as well as S_{FeC} , S_{FeC} , and S_{BC} were determined for the metallic glass $\text{Fe}_{58}\text{B}_{22}$. The Fourier-transforms yielded the pair correlation functions C_{ij} from which the atomic distances and the partial coordination numbers were calculated. The partial coordination numbers are in good agreement with those of the metastable Fe_2B -phase, which is the first crystallization product formed during annealing of the metallic glass $\text{Fe}_{58}\text{B}_{22}$. The chemical short range order parameter amounts to 100%, thus indicating perfect chemical order.

Introduction

It is the aim of the present paper to investigate by means of diffraction experiments the mutual distribution of the components in the metallic glass $\text{Fe}_{58}\text{B}_{22}$. For this purpose three independent diffraction experiments have to be performed, in each of which the ratio of the scattering powers of Fe and B must be different. This can be achieved either by applying different radiations or by using isotopes with different scattering lengths in preparing samples with the same chemical composition for neutron scattering experiments. In the present work both methods have been combined.

Theoretical Fundamentals

We will only present a short compilation of the equations needed for the evaluation of the three partial structure factors. For a comprehensive presentation see Refs. [1] to [4]. The scattering behaviour of an isotropic binary molten or amorphous alloy can be described by three partial structure factors $S_{ij}(Q)$, where $S_{ij}(Q) = S_{ji}(Q)$. From these partial functions the total function can be obtained

$$\begin{aligned} S(Q) = & \frac{c_A^2 b_A^2}{\langle b \rangle^2} S_{AA}(Q) + \frac{c_B^2 b_B^2}{\langle b \rangle^2} S_{BB}(Q) \\ & + \frac{2 c_A c_B b_A b_B}{\langle b \rangle^2} S_{AB}(Q) \\ = & W_{AA} S_{AA}(Q) + W_{BB} S_{BB}(Q) \\ & + W_{AB} S_{AB}(Q) \end{aligned} \quad (1)$$

with c_i concentration of component i in atomic fractions, b_i scattering length of the atoms of component i , $\langle b \rangle = c_A b_A + c_B b_B$.

The total structure factor $S(Q)$ is obtained from the coherently scattered intensity per atom $I_n(Q)$ which follows from the measured intensity by a correction- and normalization-procedure. The following equation stands according to the Faber-Ziman definition [5]:

$$S(Q) = \frac{I_n(Q) - \text{LMS}}{\langle b \rangle^2}. \quad (2)$$

The Laue monotonic scattering LMS

$$\text{LMS} = \langle b^2 \rangle - \langle b \rangle^2 = c_A c_B \langle b \rangle^2 \quad (3)$$

is regarded as part of the coherent scattering and is subtracted in (2). The LMS is observed in the unmodulated form given by (3) if the atoms of both components with their different scattering lengths are distributed statistically within the global structure (see for example [6]).

According to Ashcroft and Langreth [7] a total structure factor for a binary system can also be defined in the following way:

$$S_{\text{AL}}(Q) = I_n(Q)/\langle b^2 \rangle. \quad (4)$$

By this procedure the LMS is not subtracted and there is a normalization to $\langle b^2 \rangle$ and not to $\langle b \rangle^2$ as in (3).

In neutron diffraction experiments with materials containing atoms M with a magnetic moment an additional scattering contribution $I_m(Q)$ will occur which has its origin in the interaction of the magnetic moments of neutrons and the atoms M :

$$I_m(Q) = P^2(Q) S_{MM}(Q) \sin^2 \alpha \quad (5)$$

Amorphous Structures Dietrich Schulze, 1990 Treatise on Process Metallurgy, Volume 1: Process Fundamentals, 2013-11-20 Process metallurgy provides academics with the fundamentals of the manufacturing of metallic materials from raw materials into finished parts or products. Coverage is divided into three volumes entitled Process Fundamentals encompassing process fundamentals extractive and refining processes and metallurgical process phenomena. Processing Phenomena encompassing ferrous processing, non-ferrous processing and refractory reactive and aqueous processing of metals and Industrial Processes encompassing process modeling and computational tools, energy optimization, environmental aspects and industrial design. The work distils 400 years combined academic experience from the principal editor and multidisciplinary 14 member editorial advisory board providing the 2 608 page work with a seal of quality. The volumes will function as the process counterpart to Robert Cahn and Peter Haasen's famous reference family Physical Metallurgy 1996 which excluded process metallurgy from consideration and which is currently undergoing a major revision under the editorship of David Laughlin and Kazuhiro Hono publishing 2014. Nevertheless process and extractive metallurgy are fields within their own right and this work will be of interest to libraries supporting courses in the process area. Synthesizes the most pertinent contemporary developments within process metallurgy so scientists have authoritative information at their fingertips. Organized into five parts this book first looks into the historical perspective on semiconductors and metals. This book then explains the glass formation, magnetic glasses and amorphous semiconductors. The mechanical and chemical properties of these materials are also given.

Microscopic Methods in Metals Ulrich Gonser, 2012-12-06 Methods of scientific investigation can be divided into two categories they are either macroscopic or microscopic in nature The former are generally older classical methods where the sample as a whole is studied and various local properties are deduced by differentiation The microscopic methods on the other hand have been discovered and developed more recently and they operate for the most part on an atomistic scale Glancing through the shelves of books on the various scientific fields and in particular on the field of physical metallurgy we are surprised at how little consideration has been given to the microscopic methods How these tools provide new insight and information is a question which so far has not attracted much attention Similar observations can be made at scientific conferences where the presentation of papers involving microscopic methods is often pushed into a far corner This has led users of such methods to organize their own special conferences The aim of this book is to bridge the present gap and encourage more interaction between the various fields of study and selected microscopic methods with special emphasis on their suitability for investigating metals In each case the principles of the method are reviewed the advantages and successes pointed out but also the shortcomings and limitations indicated
