Resolution Improvement Methods Applied to Digital Holography Daniel Claus, 2010 This thesis discusses the creation acquisition and processing of digital holograms Several techniques to improve the optical resolution have been investigated and developed The optical resolution of numerically reconstructed digital holograms is restricted by both the sampling frequency and the overall sensor size of the digital camera chip used This thesis explores the limitations on the optical resolution of the holograms obtained A typical sensor size and sampling frequency for digital holograms is 10 mm and 100 lp mm respectively whereas holographic plates used for optical holography can be more than a meter in size and have a sampling frequency of 3000 lp mm In order to take full advantage of the benefits digital holography offers such as fast image acquisition and direct phase accessibility the problem of reduced resolution needs to be overcome Three resolution improvement methods have been developed in the scope of this PhD thesis Prior to implementing the resolution improvement methods different holographic setups have been analyzed using the Space bandwidth product SBP to calculate the information distribution both in the recording and reconstruction process The first resolution improvement method is based on the synthetic aperture method In this manner an increased sensor area can be obtained resulting in a larger numerical aperture NA A larger NA enables a more detailed reconstruction The problem encountered in doing this is that an increased optical resolution results in a smaller depth of field This has been overcome in this thesis by applying the extended depth of field method As a result a high resolution in focus reconstruction of all longitudinal object regions is obtained Moreover the extended depth of field method allows a topological mapping of the object The second resolution improvement method is based on sampling the interference pattern

with sub pixel accuracy This was carried out on a CMOS sensor and implemented by moving the light sensitive pixel area into the dead zone in a 4x4 grid to cover whole the pixel area As a result the sensor s sampling frequency is doubled The increased sampling frequency permits a reduction of the recording distance which results in an increased optical resolution of the reconstructed hologram The third and novel approach described in this thesis has been to increase the optical resolution stored in a digital hologram by the combination of the synthetic aperture and the sub pixel sampling method By analogy with the Fresnel The resolution improvement methods have been demonstrated both for lens less digital holography and digital holographic microscopy

Optical Inspection of Microsystems Wolfgang Osten, 2018-10-03. Where conventional testing and inspection techniques fail at the micro scale, optical techniques provide a fast, robust and relatively inexpensive alternative for investigating the properties and quality of microsystems. Speed, reliability and cost are critical factors in the continued scale up of microsystems technology across many industries and optical techniques are in a unique position to satisfy modern commercial and industrial demands. Optical Inspection of Microsystems is the first comprehensive up to date survey of the most important and widely used full field optical metrology and inspection technologies. Under the guidance of accomplished researcher Wolfgang Osten, expert contributors from industrial and academic institutions around the world share their expertise and experience with techniques such as image correlation, light scattering, scanning probe microscopy, confocal microscopy, fringe projection, grid and moiré techniques, interference microscopy, laser Doppler vibrometry, holography, speckle metrology and spectroscopy. They also examine modern approaches to data acquisition and processing. The book emphasizes the evaluation of various properties to increase reliability and promote a consistent approach to optical testing. Numerous practical examples and illustrations reinforce the concepts. Supplying advanced tools for microsystem manufacturing and characterization.
