

PLACER MINING

- ❑ Placer mining are *among the most economical of all mining methods* but can only be applied to limited categories of mineral deposits.
- ❑ Placer mining affects large surface areas for the volume of material mined, is highly visible and has serious environmental problems with surface disturbance and stream pollution.
- ❑ *Placer mining* is used to exploit loosely consolidated deposits like *common sand and gravel or gravels containing gold, tin, diamonds, platinum, titanium, or gems*.
- ❑ *There are two types of placer mining:-*

1) Hydraulic mining: *Generally used for weakly cemented near-surface ore deposits. Hydraulic mining of a placer gold deposit. Hydraulic mining* utilizes a high-pressure stream of water that is directed against the mineral deposit (normally but not always a placer), under-cutting it, and causing its removal by the erosive actions of the water.

2) Dredging mining: *Generally used most often for mineral-sands and some near-shore alluvial diamond mining operations. Dredging* performed from floating vessels, accomplishes the extraction of the minerals mechanically or hydraulically.

"Dredging" is a method often used to scraping- (or bring-) up underwater mineral deposits. Although dredging is usually employed to clear or enlarge waterways for boats, it can also recover significant amounts of underwater minerals relatively efficiently and cheaply.
