M. Driessens, 2019-07-11 PhD Dissertation The availability and capabilities of present day technology suggest that legged robots should be able to physically outperform their biological counterparts This thesis revolves around the philosophy that the observed opposite is caused by over complexity in legged robot design which is believed to substantially suppress design for high performance In this dissertation a design philosophy is elaborated with a focus on simple but high performance design This philosophy is governed by various key points including holistic design technology inspired design machine and behaviour co design and design at the performance envelope This design philosophy also focuses on improving progress in robot design which is inevitably complicated by the aspire for high performance It includes an approach of iterative design by trial and error which is believed to accelerate robot design through experience This thesis mainly focuses on the case study of Skippy a fully autonomous monopodal balancing and hopping robot Skippy is maximally simple in having only two actuators which is the minimum number of actuators required to control a robot in 3D Despite its simplicity it is challenged with a versatile set of high performance activities ranging from balancing to reaching record jump heights to surviving crashes from several meters and getting up unaided after a crash while being built from off the shelf technology This thesis has contributed to the detailed mechanical design of Skippy and its optimisations that abide the design philosophy and has resulted in a robust and realistic design that is able to reach a record jump height of 3.8m Skippy is also an example of iterative design through trial and error which has lead to the successful design and creation of the balancing only precursor Tippy High performance balancing has been successfully demonstrated on Tippy using a recently developed balancing algorithm that combines the objective of tracking a desired position command with balancing as required for preparing hopping motions This thesis has furthermore contributed to several ideas and theories on Skippy's road of completion which are also useful for designing other high performance robots These contributions include 1 the introduction of an actuator design criterion to maximize the physical balance recovery of a simple balancing machine 2 a generalization of the centre of percussion for placement of components that are sensitive to shock and 3 algebraic modelling of a non linear high gravimetric energy density compression spring with a regressive stress strain profile The activities performed and the results achieved have been proven to be valuable however they have also delayed the actual creation of Skippy itself A possible explanation for this happening is that Skippy's requirements and objectives were too ambitious for which many complications were encountered in the decision making progress of the iterative design strategy involving trade offs between exercising trial and error elaborate simulation studies and the development of above mentioned new theories Nevertheless from 1 the resulting realistic design of Skippy 2 the successful creation and demonstrations of Tippy and 3 the contributed

theories for high performance robot design it can be concluded that the adopted design philosophy has been generally successful Through the case study design project of the hopping and balancing robot Skippy it is shown that proper design for high physical performance 1 can indeed lead to a robot design that is capable of physically outperforming humans and animals and 2 is already very challenging for a robot that is intended to be very simple Flea Market Trader Sharon Huxford,Bob Huxford,1999-02 The latest edition of this popular guide includes over 10 000 alphabetical listings current values hundreds of photos a handy Index and a directory of advisors Kubernetes Cookbook Sameer Naik,Sébastien Goasguen,Jonathan Michaux,2023-11-13 Kubernetes is the de facto standard for container orchestration and distributed applications management across a microservices framework With this practical cookbook you ll learn hands on Kubernetes recipes for automating the deployment scaling and operations of application containers across clusters of hosts In this fully updated second edition Sameer Naik S bastien Goasguen and Jonathan Michaux from TriggerMesh provide a problem solution discussion format with easy lookups to help you find the detailed answers you need fast Kubernetes lets you deploy your applications quickly and predictably so you can efficiently respond to customer demand This cookbook delivers the essential knowledge that developers and system administrators need to get there Recipes in this cookbook focus on Creating a Kubernetes cluster Using the Kubernetes command line interface Managing fundamental workload types Working with services Exploring the Kubernetes API Managing stateful and non cloud native apps Working with volumes and configuration data Cluster level and application level scaling Securing your applications Monitoring and logging Maintenance and troubleshooting
