Baturin, 2011-10-02 Manganese nodules were first discovered on the ocean floor 160 miles south west of the Canary Islands on February 18 1803 during the first complex oceanological cruise of the Challenger They surprised researchers by their unusual shape and also by their unusual chemical composition nevertheless for many years afterwards they were considered merely as one of Nature's exotic marine tricks After the Second World War a comprehensive investigation of the World Ocean started and new data were obtained on a wide distribution of manganese nodules and their polymetallic composition that made scientists consider nodules as one of the major characteristics of the deep oceanic zone Recently meaning since the 1960s nodules have been recognized as a potential ore source investigation of which is stimulated by the progressive depletion of land based mineral resources Several generations of scientists from various countries have contributed to the problem of exploration of manganese nodules on the ocean floor Though the problem has been posed it has not been solved yet because it required in its turn a scrutiny of some fundamental aspects such as composition nature accretion rate of nodules and retrieval of nodule fields These problems have been discussed in thousands of papers and larger publications see in particular Mero 1965 Horn 1972 Morgenstein 1973 Bezrukov 1976 Glasby 1977 Bischoff and Piper 1979 Lalou 1979 Manganese nodules 1979 Varentsov 1980 Cronan 1980 Manganese nodules 1984 1986 Analysis of the World Distribution of Metal-rich Subsea Manganese Nodules Vincent Ellis McKelvey, Nancy A. become a potential mineral resource of major importance Nodules that cover the sea floor of the tropical North Pacific may represent a vast ore deposit of manganese nickel cobalt and copper Modern technology has apparently surmounted the incredible problem of recovering nodules in water depths of 5000 meters and the extraction of metals from the complex chemical nodule matrix is a reality Both the recovery and the extraction appear to be economically feasible Exploitation of this resource is however hindered more by the lack of an international legal structure allowing for recognition of mining sites and exploitation rights than by any other factor Often when a mineral deposit becomes identified as an exploitable resource scientific study burgeons Interest in the nature and genesis of the deposit increases and much is learned from large scale exploration The case is self evident for petroleum and ore deposits on land The study of manganese nodules is just now entering this phase What was the esoteric field of a few scientists has become the subject of active exploration and research by most of the industrialized nations Unfortunately for our general understanding of manganese nodules exploration results remain largely proprietary However scientific study has greatly increased and the results are becoming widely available
