Fung, 1981 SAR Temporal Series Interpretation and Backscattering Modelling for Maize Growth Monitoring Éric Auquièrè, 2001

The research objective is to develop a methodology for the extraction of bio and geophysical variables from Synthetic Aperture Radars SAR and for their use in the perspective of maize monitoring in an operational context SARs interest agronomists because they present some advantages for vegetation monitoring However the actual revisit cycle of SARs is not sufficient for crop monitoring The image processing chain we developed overcomes this issue and meets the 4 requirements for operational crop monitoring a high temporal resolution a high geometric accuracy a short processing time and the preservation of the signal content From the literature we know that the interactions between the signal backscattered by the vegetation and by the underlying soil are very complex To understand these interactions we carried out very intensive ground campaigns The resulting data set is very rich It covers 3 growing seasons during which 30 ERS SAR images and 13 RADARSAT SAR images were acquired and processed In total 612 fields i e 581 maize fields and 31 sugar beet fields were located and visited These field campaigns represent 2500 field visits and more or less 7500 measurements of 8 variables One of the major outputs of this research comes from the analysis of the temporal behaviour of the SAR signal distribution at both field and regional levels The SAR signal is analysed by the mean of the per field backscattering coefficient Previous results concerning the respective contribution of soil and crop are confirmed The research also addresses the use of several regional indicators We point out a drop of per field variation coefficient averaged at regional level and we link it to the decrease of the intra parcel variability of the soil roughness and to the progressive masking effect of the crop canopy on different sources of variability The spatial variability of the ERS per field backscattering coefficients is related to the variability of the sowing dates Finally existing and new versions of the cloud model are calibrated and validated The cloud model is adapted to account for the data available from the field campaigns The results

show that SAR do not allow the prediction of the maize biomass at the field level but they can be used to give an indication on the crop status at a regional level *Active and Passive Microwave Remote Sensing of Soil Moisture* Rajat Bindlish,2000

Microwave Indices from Active and Passive Sensors for Remote Sensing Applications Emanuele Santi, Simonetta Paloscia, 2019-10-21 Past research has comprehensively assessed the capabilities of satellite sensors operating at microwave frequencies both active SAR scatterometers and passive radiometers for the remote sensing of Earth's surface. Besides brightness temperature and backscattering coefficient, microwave indices defined as a combination of data collected at different frequencies and polarizations revealed a good sensitivity to hydrological cycle parameters such as surface soil moisture, vegetation water content, and snow depth and its water equivalent. The differences between microwave backscattering and emission at more frequencies and polarizations have been well established in relation to these parameters, enabling operational retrieval algorithms based on microwave indices to be developed. This Special Issue aims at providing an overview of microwave signal capabilities in estimating the main land parameters of the hydrological cycle, e.g., soil moisture, vegetation water content, and snow water equivalent, on both local and global scales, with a particular focus on the applications of microwave indices.

Comprehensive Remote Sensing Shunlin Liang, 2017-11-08 Comprehensive Remote Sensing Nine Volume Set covers all aspects of the topic with each volume edited by well-known scientists and contributed to by frontier researchers. It is a comprehensive resource that will benefit both students and researchers who want to further their understanding in this discipline. The field of remote sensing has quadrupled in size in the past two decades and increasingly draws in individuals working in a diverse set of disciplines ranging from geographers, oceanographers, and meteorologists to physicists and computer scientists. Researchers from a variety of backgrounds are now accessing remote sensing data, creating an urgent need for a one-stop reference work that can comprehensively document the development of remote sensing from the basic principles, modeling, and practical algorithms to various applications. Fully comprehensive coverage of this rapidly growing discipline giving readers a detailed overview of all aspects of Remote Sensing principles and applications. Contains Layered content with each article beginning with the basics and then moving on to more complex concepts. Ideal for advanced undergraduates and academic researchers. Includes case studies that illustrate the practical application of remote sensing principles, further enhancing understanding.

Basics of Geomatics Mario A. Gomasasca, 2009-09-18 Geomatics is a neologism the use of which is becoming increasingly widespread even if it is not still universally accepted. It includes several disciplines and techniques for the study of the Earth's surface and its environments, and computer science plays a decisive role. A more meaningful and appropriate expression is Geo-spatial Information or GeoInformation. Geo-spatial Information embeds topography in its more modern forms: measurements with electronic instrumentation, sophisticated techniques of data analysis, and network compensation, global satellite positioning techniques, laser scanning, etc., analytical and digital photogrammetry, satellite and airborne remote sensing, numerical cartography.
