## **Parallel Algorithms For Linear Models Numerical Methods And Estimation Problems:**

*Parallel Algorithms for Linear Models* Erricos Kontoghiorghes, 2000-01-31 *Parallel Algorithms for Linear Models* provides a complete and detailed account of the design analysis and implementation of parallel algorithms for solving large scale linear models. It investigates and presents efficient numerically stable algorithms for computing the least squares estimators and other quantities of interest on massively parallel systems. The monograph is in two parts. The first part consists of four chapters and deals with the computational aspects for solving linear models that have applicability in diverse areas. The remaining two chapters form the second part which concentrates on numerical and computational methods for solving various problems associated with seemingly unrelated regression equations, SURE and simultaneous equations models. The practical issues of the parallel algorithms and the theoretical aspects of the numerical methods will be of interest to a broad range of researchers working in the areas of numerical and computational methods in statistics and econometrics, parallel numerical algorithms, parallel computing and numerical linear algebra. The aim of this monograph is to promote research in the interface of econometrics, computational statistics, numerical linear algebra and parallelism. Computational Methods in Decision-Making, Economics and Finance Erricos John Kontoghiorghes, B. Rustem, S. Siokos, 2002-08-31 Computing has become essential for the modeling analysis and optimization of systems. This book is devoted to algorithms, computational analysis and decision models. The chapters are organized in two parts: optimization models of decisions and models of pricing and equilibria. Optimization is at the core of rational decision making. Even when the decision maker has more than one goal or there is significant uncertainty in the system, optimization provides a rational framework for efficient decisions. The Markowitz mean variance formulation is a classical example. The first part of the book is on recent developments in optimization decision models for finance and economics. The first four chapters of this part focus directly on multi stage problems in finance. Chapters 5-8 involve the use of worst case robust analysis. Chapters 9-11 are devoted to portfolio optimization. The final four chapters are on transportation inventory with stochastic demand, optimal investment with CRRA utility, hedging financial contracts and automatic differentiation for computational finance. The uncertainty associated with prediction and modeling constantly requires the development of improved methods and models. Similarly, as systems strive towards equilibria, the characterization and computation of equilibria assists analysis and prediction. The second part of the book is devoted to recent research in computational tools and models of equilibria prediction and pricing. The first three chapters of this part consider hedging issues in finance. Chapters 19-22 consider prediction and modeling methodologies. Chapters 23-26 focus on auctions and equilibria. Volatility models are investigated in chapters 27-28. The final two chapters investigate risk assessment and product pricing. Audience: Researchers working in computational issues related to economics, finance and management science. **Handbook of Parallel Computing and Statistics** Erricos John Kontoghiorghes, 2005-12-21 Technological improvements continue to push back the frontier of processor speed in modern

computers Unfortunately the computational intensity demanded by modern research problems grows even faster Parallel computing has emerged as the most successful bridge to this computational gap and many popular solutions have emerged based on its concepts *Parallel Algorithms for Linear Models* Erricos Kontoghiorghes,2000-01-01 **The Rational Expectation Hypothesis, Time-Varying Parameters and Adaptive Control** Marco P. Tucci,2012-12-06 One of the major controversies in macroeconomics over the last 30 years has been that on the effectiveness of stabilization policies However this debate between those who believe that this kind of policies is useless if not harmful and those who argue in favor of it has been mainly theoretical so far The Rational Expectation Hypothesis Time Varying Parameters and Adaptive Control wants to represent a step toward the construction of a common ground on which to empirically compare the two beliefs and to do this three strands of literature are brought together The first strand is the research on time varying parameters TVP the second strand is the work on adaptive control and the third one is the literature on linear stationary models with rational expectations RE The material presented in The Rational Expectation Hypothesis Time Varying Parameters and Adaptive Control is divided into two parts Part 1 combines the strand of literature on adaptive control with that on TVP It generalizes the approach pioneered by Tse and Bar Shalom 1973 and Kendrick 1981 and one recently used in Amman and Kendrick 2002 where the law of motion of the TVP and the hyperstructural parameters are assumed known to the case where the hyperstructural parameters are assumed unknown Part 2 is devoted to the linear single equation stationary RE model estimated with the error in variables EV method It presents a new formulation of this problem based on the use of TVP in an EV model This new formulation opens the door to a very promising development All the theory developed in the first part to control a model with TVP can sic et simpliciter be applied to control a model with RE *Economic Simulations in Swarm: Agent-Based Modelling and Object Oriented Programming* Francesco Luna,Benedikt Stefansson,2012-12-06 Computer simulations of economic systems are slowly gaining ground within the economic profession However such a process is hindered by a lack of communication among researchers who do not share a common language For its object oriented structure and its versatility Swarm has the necessary characteristics to become a credible universal language of agent based simulations Economic Simulations in Swarm collects a series of original articles in such domains as macro and micro economics industrial organization monetary theory and finance all linked by a common denominator the use of the Swarm simulation platform Swarm a standard set of program libraries allows users to construct simulations where a collection of heterogeneous independent agents or elements interact through discrete events This volume offers the first extensive tutorial to the use of these software libraries developed at the Santa Fe Institute as part of the ongoing research into complexity The editors conceived the idea of this book while visiting the Santa Fe Institute as members of the Working Group on Adaptive and Computable Economics Francesco Luna is a specialist in Computable Economics and Benedikt Stefansson is an active contributor to the Swarm community Quantitative Economic Policy Reinhard Neck,Christian Richter,Peter
