Schmoker, 2012-12-06 Since 1958 the Association for the Study of Internal Fixation ASIF has worked to establish the experimental and biomechanical principles of the operative treatment of fractures It has been proven that immediate pain free mobilization made possible by stable internal fixation is the key to restoring function in a fractured extremity The same

principles were applied in 1972¹⁷³ by Roland Schmoker who developed a universal plate and sophisticated instrument set designed initially for the treatment of comminuted fractures of the mandible To extend the applications of his plate to reconstructions after extensive tumor resections he supplemented the device with temporomandibular joint prostheses and anchoring elements for the attachment of dentures He first tested the functional stability of these implants experimentally in sheep Later he found that the minipig had a more human like jaw shape and masticatory action and so he tested the implants in 37 mini pigs that underwent extensive mandibular resections without bone grafting using sequential dye injections and postoperative weight gain to chart the progress of osseous regeneration Seven other animals were not operated and served as controls
