## **Parallel Complexity Of Linear System Solution:**

Parallel Complexity Of Linear System Solution Bruno Codenotti,Mauro Leoncini,1991-04-30 This book presents the most important parallel algorithms for the solution of linear systems Despite the evolution and significance of the field of parallel solution of linear systems no book is completely dedicated to the subject People interested in the themes covered by this book belong to two different groups numerical linear algebra and theoretical computer science and this is the first effort to produce a useful tool for both The book is organized as follows after introducing the general features of parallel algorithms and the most important models of parallel computation the authors analyze the complexity of solving linear systems in the circuit PRAM distributed and VLSI models The approach covers both the general case i e dense linear systems without structure and many important special cases i e banded sparse Toeplitz circulant linear systems

### **Parallelism in Matrix**

**Computations** Efstratios Gallopoulos,Bernard Philippe,Ahmed H. Sameh,2015-07-25 This book is primarily intended as a research monograph that could also be used in graduate courses for the design of parallel algorithms in matrix computations It assumes general but not extensive knowledge of numerical linear algebra parallel architectures and parallel programming paradigms The book consists of four parts I Basics II Dense and Special Matrix Computations III Sparse Matrix Computations and IV Matrix functions and characteristics Part I deals with parallel programming paradigms and fundamental kernels including reordering schemes for sparse matrices Part II is devoted to dense matrix computations such as parallel algorithms for solving linear systems linear least squares the symmetric algebraic eigenvalue problem and the singular value decomposition It also deals with the development of parallel algorithms for special linear systems such as banded Vandermonde Toeplitz and block Toeplitz systems Part III addresses sparse matrix computations a the development of parallel iterative linear system solvers with emphasis on scalable preconditioners b parallel schemes for obtaining a few of the extreme eigenpairs or those contained in a given interval in the spectrum of a standard or generalized symmetric eigenvalue problem and c parallel methods for computing a few of the extreme singular triplets Part IV focuses on the development of parallel algorithms for matrix functions and special characteristics such as the matrix pseudospectrum and the determinant The book also reviews the theoretical and practical background necessary when designing these algorithms and includes an extensive bibliography that will be useful to researchers and students alike The book brings together many existing algorithms for the fundamental matrix computations that have a proven track record of efficient implementation in terms of data locality and data transfer on state of the art systems as well as several algorithms that are presented for the first time focusing on the opportunities for parallelism and algorithm robustness
