Parallel Image Processing:

Parallel Image Processing T. Bräunl, S. Feyrer, W. Rapf, M. Reinhardt, 2013-04-17 This book developed out of a series of publications in the area of image processing with massively parallel algorithms. The topic of image processing is a particularly promising area for the use of synchronous, massively parallel or data parallel computer systems which work according to the SIMD principle (single instruction, multiple data). While the era of large SIMD super computers has passed, SIMD systems have come back as dedicated vision subsystems and will soon be found even in embedded systems. In comparison to conventional sequential implementations of basic image operations, this book illustrates the intrinsic parallelism which is almost always present in image processing. By utilising parallel algorithms, it is even possible to illustrate operations in a simpler and easier to understand way than for the sequential case. The presentation method chosen for this book assumes that short, terse excerpts of program code will significantly enhance the understanding of the material, e.g. of image operations, while longer listings are more likely to distract from the topic. For this reason, each chapter will not only define and explain the central image processing algorithms with the help of examples, but will also give an excerpt of a massively parallel program. For image processing, this means that at least virtually, there should be one processor available for each pixel. The mapping onto a smaller number of existing compilers and existing real processors is done transparently; this is not of interest here.

Visual Information Representation, Communication, and Image Processing Ya-Qin Zhang, 1999-05-25 Discusses recent advances in the related technologies of multimedia computers, videophones, video over Internet, HDTV, digital satellite TV and interactive computer games. The text analyzes ways of achieving more effective navigation techniques, data management functions and higher throughput networking. It synthesizes data on visual information, tracking the enormous commercial potential for new components and compatible systems.

Real Time Low Level Parallel Image Processing for Active Vision Systems, Parallel Algorithms for Digital Image Processing, Computer Vision and Neural Networks Ioannis Pitas, 1993-04-09 World renowned contributors present papers concerning algorithms used on the latest generation of parallel machines, MIMD. Details key applications running the gamut from medical imaging, visualization and remote sensing to HDTV, demonstrating the large computational complexity necessary to perform these tasks.

Parallel and Distributed Algorithms for High-Speed Image Processing, 2000
Typical desktop workstations can be a severe bottleneck in the viewing and enhancement of imagery data. Due to the nature of many image processing algorithms, an effective method for alleviating this problem is through parallelism. Parallel hardware can come in many forms, from small clusters of workstations and workstations with many processors to dedicated hardware containing 10s, 100s and 1000s of processing nodes. One of the challenges is developing a portable parallel image

processing library in such a potentially diverse environment. These issues led to the development of a Parallel Image Processing Toolkit PIPT. The toolkit hides the detail of parallelization from the users of the PIPT and provides a uniform programming interface. In developing the toolkit the issues of advanced data handling, load balancing and parallel visualization were addressed. In addition a specific computationally expensive High Resolution Video Stills algorithm was implemented within the PIPT. The important contributions that resulted from this work transcend the individual tasks that were undertaken. First the general approach that was taken to implement the PIPT illustrates several important principles for the design and implementation of general purpose parallel libraries. In this regard the PIPT design can serve as a design pattern for an extensible parallel library. Second the design pattern of the current implementation of the PIPT contains some notable attempts at programming image processing tasks in a generic fashion.

High-Performance Medical Image Processing Sanjay Saxena, Sudip Paul, 2022-07-07. The processing of medical images in a reasonable timeframe and with high definition is very challenging. This volume helps to meet that challenge by presenting a thorough overview of medical imaging modalities, its processing, high performance computing and the need to embed parallelism in medical image processing techniques to achieve efficient and fast results. With contributions from researchers from prestigious laboratories and educational institutions, *High Performance Medical Image Processing* provides important information on medical image processing techniques, parallel computing techniques and embedding parallelism in different image processing techniques. A comprehensive review of parallel algorithms in medical image processing problems is a key feature of this book. The volume presents the relevant theoretical frameworks and the latest empirical research findings in the area and provides detailed descriptions about the diverse high performance techniques. Topics discussed include parallel computing, multicore architectures and their applications in image processing, machine learning applications, conventional and advanced magnetic resonance imaging methods, hyperspectral image processing algorithms for segmenting 2D slices for 3D viewing and more. Case studies such as on the detection of cancer tumors expound on the information presented. Key features: Provides descriptions of different medical imaging modalities and their applications. Discusses the basics and advanced aspects of parallel computing with different multicore architectures. Expounds on the need for embedding data and task parallelism in different medical image processing techniques. Presents helpful examples and case studies of the discussed methods. This book will be valuable for professionals, researchers and students working in the field of healthcare engineering, medical imaging technology, applications in machine and deep learning and more. It is also appropriate for courses in computer engineering, biomedical engineering and electrical engineering based on artificial intelligence, parallel computing, high performance computing and machine learning and its applications in medical imaging.
