

# PARSEC-SCALE JETS IN EXTRAGALACTIC RADIO SOURCES<sup>1</sup>

KEY WORDS: compact radio sources, radio source morphology, radio jets, VLBI jets, superluminal motion, jet models

## ABSTRACT

Observations of parsec-scale radio jets associated with active galactic nuclei are reviewed, with a particular emphasis on high-luminosity core-dominated sources where the most detailed information on individual objects exists. Extensive imaging surveys with very long baseline interferometry (VLBI) have made possible a morphologic classification of compact radio sources and systematic studies of the statistics of apparent (often faster-than-light) motions found in an increasing number of sources. VLBI monitoring studies at centimeter and millimeter wavelengths, enhanced by spectral and polarization imaging, of representative types of AGN can discriminate detailed physical models. The observations are especially discussed in light of the variant of the relativistic beaming model that explains kinematic, spectral, and polarization properties of parsec-scale jets through shocks in an underlying continuous jet flow.

## INTRODUCTION

The radio emission from radio-loud active galactic nuclei (AGN) ordinarily takes the form of collimated "jets" that connect a compact central region with kiloparsec-scale extended lobes and hot spots. For the past two decades, the structure and emission properties of these jets have been studied extensively

## Parsec Scale Radio Jets:

*Parsec-Scale Radio Jets* J. Anton Zensus, Timothy J. Pearson, 1990-08-16 Quasars and active galaxies are the most powerful emitters of radiation in the universe Modern radio telescope arrays have shown that the ultimate energy source resides in the central few parsecs of the galactic nucleus and powers the emitting regions by way of two oppositely directed relativistic jets of energy This volume presents the latest observations and theories of these remarkable objects Topics discussed include superluminal motions the physics of jets and shock fronts in jets related optical observations and cosmic evolution Particular attention is given to the unified theories which attempt to show that many of the phenomena in powerful extragalactic objects are different aspects of a single basic mechanism the main difference in their appearance is a result of their different orientation with respect to the observer

Padrielli, 2012-12-06 On the 100th anniversary of Marconi's successful experiment on radio broadcasting 250 astronomers from all over the world met in Bologna Italy for five days to update their knowledge of the physics and statistical properties of powerful extragalactic radio sources Since their discovery in the fifties enormous

progress has been made The existence of superluminal motions in the cores of radio sources the presence there of a black hole surrounded by an absorbing dust torus as inferred mostly from studies at other wavelengths are now accepted ideas Nevertheless in spite of these efforts there are many questions still unanswered For instance we do not know which mechanism produces the huge amount of energy supplied to radio sources how the jets connecting the engine to the lobes are formed and collimated which of the differences observed among the various classes of radio sources are apparent and which are real These and other related topics are discussed in this book **Quasars and Active Galactic Nuclei** Ajit K. Extragalactic Jets Travis Arthur Rector,David De Young,2008 These proceedings of an international meeting held May 2007 in Girdwood Alaska USA provide a comprehensive overview of recent theoretical and observational work on the nature of extragalactic jets from parsec to kiloparsec scales Special emphasis is given to the interaction of jets with their environment and to the insights this interaction can provide The invited reviews contributed talks and poster sessions form a detailed summary of the latest findings as well as illustrate outstanding questions that remain to be resolved This book is suitable for researchers and graduate students The origin and evolution of highly collimated and highly energetic outflows from the nuclei of some galaxies remains after over 30 years of intensive study and enigmatic process We still do not know how these jets are collimated or what they contain beyond relativistic particles and magnetic fields much less how they come to be in the first place If we could unravel the mystery of their origins then it is clear that new and significant constraints could also be placed on the origin and evolution of the central engine presumably a massive black hole that creates them This in turn would give rise to new constraints on the formation and evolution of the parent galaxies and their environment The quest for insights into the nature of these objects has always been made difficult by the lack of information conveyed by their simple power law radiation spectrum and so much of the information gained must be inferential However the hope remains that by gaining an understanding of the interaction of these objects with their environment we may be able to deduce the key

parameters of the jets themselves This strategy of working from the outside in is showing increasing promise as higher resolution observations with increasing sensitivity are being made over increased coverage in wavelength especially as these are cast against results from sophisticated theoretical calculations that include three dimensional MHD simulations Publisher s website *Radio Emission from Galactic and Extragalactic Compact Sources* J.
