## Particle Field Holography:

**Particle Field Holography** Chandra S. Vikram, 1992-07-23 This is the first book to provide a thorough and systematic description of the entire subject of particle field holography. The use of holography to study very small objects in a dynamic volume is a technique of importance for scientists and engineers across a variety of disciplines for obtaining information about the size, shape, and velocity of small objects such as dust particles, fuel droplets, raindrops, pollen, and bubbles. Professor Vikram has made major contributions to the field and here provides a coherent, comprehensive, and self-contained treatment of the theory, practice, and applications. The volume is written to satisfy the needs of researchers in the technique, practicing engineers dealing with applications, and advanced students in science or engineering departments. All the necessary mathematical formulations, figures, and photographs, experimental procedures, and results, and literature citations are therefore included.

In-line Particle Field Holography at Pegasus, 1995 An in-line holographic imaging system has been developed for hydrodynamic experiments at the Pegasus facility located at Los Alamos National Laboratory. Holography offers the unique capability to record distributions of particles over a three-dimensional volume. The system to be discussed is used to measure particle distributions of ejecta emitted after a cylindrical aluminum liner, 5.0 cm in diameter, 2.0 cm high, impacts a target, 3.0 cm in diameter. The ejecta emerges from the target traveling up to 7 mm  $\mu$ s and moves toward the axial center of the system where the holographic imaging is performed. In-line holography is particularly suited for the Pegasus pulsed power facility where the geometry restrictions make off-axis holography impractical. In order to record the fast-moving particles, a frequency-doubled Nd:YAG laser system has been implemented which produces a 80 ps, 20 mJ pulse at 532 nm. An optical relay system composed of a Fourier optical lens pair has been developed which is placed 4.0 cm from the center of the region of interest. This relay lens pair forms an intermediate image 32 cm from the object plane, and the hologram is placed 4 cm downstream of the intermediate image. The holographic system and resolution capability are discussed.

**Combustion Measurements** Norman Chigier, 2024-11-01 The book begins with an introduction to the general problems of making measurements in high temperature and a presentation of chemically reacting flow systems. It describes each instrument with the various diagnostic techniques and discusses measurements that have been made in furnaces, flames, and rocket engines. The detailed measurement techniques described in this book cover a wide spectrum of applications in combustion systems, including gas turbine, rocket measurement techniques that were developed in laboratories. Information obtained on detailed temperature, velocity, particle size, and gas concentration distribution is leading to improved understanding of the chemical combustion process and to design improvements in combustors.
