

## Swash regime

$$R_{\text{high}} < D_{\text{low}}$$

- Impact restricted to beachface and nearshore
- Erosion or deposition
- Onshore or offshore transport

## Collision regime

$$D_{\text{low}} < R_{\text{high}} \ll D_{\text{high}}$$

- Large impacts on beach and barrier front
- Erosional scarp in the dune diff
- Intense offshore sediment transport

## Overwash regime

$$R_{\text{high}} > D_{\text{high}}$$

- Waves locally overtop the barrier crest in its lower parts
- Washover deposition
- Occasional breaching and salt-water intrusion in the back-barrier domain

## Inundation regime

$$R_{\text{low}} > D_{\text{high}}$$

- General overtopping of the barrier and flattening of the barrier topography
- Massive landward sediment transport and deposition
- Likely ecological impacts due to massive salt-water input in the back-barrier domain

**Theoretical Morphodynamics: Straight Channels** Giovanni

Seminara, Stefano Lanzoni, Nicoletta Tambroni, 2024-03-15 This monograph presents the mechanistic foundations of the theory of Morphodynamics a discipline that investigates the shape of the erodible boundary of natural water bodies We focus on the fluvial Morphodynamics of straight erodible channels providing the basis for subsequent extensions to meandering rivers treated in the companion monograph 2 of this series and braided rivers We present basic notions on the Mechanics of Turbulent Flows and Sediment Transport in straight open channels with mobile beds We then investigate their morphodynamic equilibrium and its instability that leads to the formation of a variety of bedforms observed in natural rivers In particular fluvial bars will deserve special attention as the fundamental building block of large scale fluvial patterns

River, Coastal and Estuarine Morphodynamics: RCEM

2007, Two Volume Set C. Marjolein Dohmen-Janssen, Suzanne J.M.H. Hulscher, 2019-08-22 This book brings together contributions from some 200 scientists from more than 20 countries who present and discuss the latest scientific research developments on this topic It is organized around the general themes of relations between scales and long term morphodynamics such as biogeomorphology small scale processes and grain sorting morphodynamic free behavior human interferences in morphodynamics The book provides an excellent overview of the state of the art knowledge on River Coastal and Estuarine Morphodynamics and will be of interest to academics engineers planners national and local authorities and all those involved in managing river estuarine and coastal habitats

Modeling morphodynamic evolution in alluvial estuaries

Mick van der Wegen, 2010-12-30 The main objective of this research is to investigate the governing processes and characteristics that drive morphodynamic evolution in alluvial estuaries by application of a process based numerical model Delft3D It is of utmost importance to understand estuarine processes so that impact of human interference like dredging and land reclamation and long term changes like sea level rise can be evaluated The research addresses a number of cases ranging from an rectangular basins to real estuaries like the Western Scheldt in the Netherlands or San Pablo Bay in California The more schematized approach allow to study morphodynamic evolution over several millennia under constant forcing and answers more fundamental questions related to conditions of equilibrium and related time scales The more realistic cases give insight into the skill of the approach in predicting decadal morphodynamic developments More processes are included to mimic realistic conditions and model results are compared to bathymetric measurements over the last century The research shows that the modeling approach is good capable of describing stable morphodynamic calculations over a timescale of millennia with patterns similar to patterns observed in reality Additionally the approach shows that it is possible to predict decadal morphodynamic developments in real estuaries with significant skill

*Geomorphology*, 2013-02-27 The changing focus and approach of geomorphic research suggests that the time is opportune for a summary of the state of discipline The number of peer reviewed papers published in geomorphic journals has grown steadily for more than two decades and more importantly the diversity of authors with respect to geographic location and disciplinary background geography geology ecology civil engineering computer science geographic information science and others has expanded dramatically As more good minds are drawn to geomorphology and the breadth of the peer reviewed literature grows an effective summary of contemporary geomorphic knowledge becomes increasingly difficult The fourteen volumes of this Treatise on Geomorphology will provide an important reference for users from undergraduate students looking for term paper topics to graduate students starting a literature review for their thesis work and professionals seeking a concise summary of a particular topic Information on the historical development of diverse topics within geomorphology provides context for ongoing research discussion of research strategies equipment and field methods laboratory experiments and numerical simulations reflect the multiple approaches to understanding Earth s surfaces and summaries of outstanding research questions highlight future challenges and suggest productive new avenues for research Our future ability to adapt to geomorphic changes in the critical zone very much hinges upon how well landform scientists comprehend the dynamics of Earth s diverse surfaces This Treatise on Geomorphology provides a useful synthesis of the state of the discipline as well as highlighting productive research directions that Educators and students researchers will find useful Geomorphology has advanced greatly in the last 10 years to become a very interdisciplinary field Undergraduate students looking for term paper topics to graduate students starting a literature review for their thesis work and professionals seeking a concise summary of a particular topic will find the answers they need in this broad reference work which has been designed and written to accommodate their diverse backgrounds and levels of understanding Editor in Chief Prof J F Shroder of the University of Nebraska at Omaha is past president of the QG G section of the Geological Society of America and present Trustee of the GSA Foundation while being well respected in the geomorphology research community and having won numerous awards in the field A host of noted international geomorphologists have contributed state of the art chapters to the work Readers can be guaranteed that every chapter in this extensive work has been critically reviewed for consistency and accuracy by the World expert Volume Editors and by the Editor in Chief himself No other reference work exists in the area of Geomorphology that offers the breadth and depth of information contained in this 14 volume masterpiece From the foundations and history of geomorphology through to geomorphological innovations and computer modelling and the past and future states of landform science no stone has been left unturned [Changjiang Riverine and Estuarine Hydro-morphodynamic Processes](#) Zhijun Dai, 2021-08-07 This book provides a comprehensive and systematic analysis of the morphodynamic process of the Changjiang River from upstream to estuary in the Anthropocene As the longest river in China the Changjiang River has nurtured Chinese civilization with ample natural resources for thousands of years Evidence highlights that the Changjiang

River has experienced intensive human interference and indicated dramatic changes in the Anthropocene including no flood in flood season no dry in dry season in discharge less flood in flood season more dry in dry season in sediment riverbed shifts from accretion to erosion lakes in the middle lower reach turn from sediment sink to source estuarine tidal flat exhibits self organization characteristics and maintains the current accretion state estuarine branches that connect to the sea show distinct morphodynamic patterns and depocenters of the submerged delta indicate periodic shifts The book stresses that dam construction upstream practically the Three Gorges Dam the world's largest hydraulic engineering project has significant influences on the hydrology and geomorphology of the middle lower reach but has a slight effect on estuarine delta development The geomorphological structure of the estuarine channel is dominated by local land reclamation navigation and dredging This book clarifies the river estuary morphodynamics of the Changjiang River and indicates the general features of global mega rivers under human interference as well as their own response mechanisms This book also exhibits the potential risk of river estuary deltas in the future as both material and dynamics are experiencing acceleration adjustment

**Handbook of Beach and Shoreface Morphodynamics** Andrew D. Short, 1999 A highly readable book on the nature of beaches including the dynamics of the shoreface surf swash and backbeach and globally at the regional variations in beach systems from the tropics to the poles The beach and adjacent shoreface are the most dynamic part of the Earth's surface They represent a narrow zone where waves tides and winds continuously interact producing wherever sediment is available hundreds of thousands of kilometres of beach systems Beaches are also the focus of intense pressure from users and developers and for these reasons alone a knowledge of beach systems and their morphodynamics is critical to their sustainable management This book is the first to provide an in depth and holistic view of beach systems looking both in detail at the different beach zones and globally at range of parameters influencing regional variation examine the relationship between beaches and ancillary dune systems and includes chapters on beach ecology safety stratification and barrier evolution The book is designed for use in the classroom and the office being aimed at university level students and coastal professionals

**River, Coastal, and Estuarine Morphodynamics**, 2008

**Coasts** C. D. Woodroffe, 2002 Coasts are some of the most rapidly changing places on earth Understanding the natural adjustments that occur between coastal landforms and the processes that influence them is essential for the better management of coastal resources Coasts provides a necessary background in geomorphology for those studying coastal systems It describes the landforms that occur on the coast their responses to the processes that shape them and the pattern of evolution that can be determined for different types of coast over thousands of years Numerous examples from around the world are used to illustrate the variety of environments Particular attention is paid to coastal morphodynamics the co adjustment of process and form on rocky reef sandy deltaic estuarine and muddy coasts This valuable text for advanced undergraduate and graduate students is well illustrated and contains an extensive reference section It will also be of great interest to environmental scientists geologists
