## Failed, challenged and successfull projects by each development paradigm

## Comparing development paradigm effectiveness

Survey results, scale from -10 to 10 (Note that the highest point on this scale is 6.3. Why so low?)

## Definitions of paradigms

### Iterative development

Process is organized into periods (iterations or time boxes). On any given day, team members may be gathering requirements, designing, coding, testing, and so on. An example of an iterative process is RUP.

### Agile development

An iterative process which is also lightweight, highly collaborative, self-organizing, and quality focused. An example of an Agile process is OpenUP, Scrum, and XP.

### Lean development

Customer value-focused philosophy. A lean process strives to optimize value to the end customer, while minimizing waste which may be measured in terms of time, quality, and cost. Examples include Kanban and Scrumban.

### Ad-Hoc development

On an ad-hoc software development project the team does not follow a defined process.

### Traditional development

Staged process: the requirements are first identified, then the architecture/design is defined, then the coding occurs, then testing, then deployment. Often referred to as "waterfall" or simply "serial" process.

Agresti,1986    **Shifting Paradigms in Software Engineering** Roland Mittermeir,1992-09-04 Object orientation and the need for multi paradigmatic systems constitute a challenge for researchers practitioners and instructors Presentations at the OCG NJSZT joint conference in Klagenfurt Austria in September 1992 addressed these issues The proceedings comprise such topics as project management artificial intelligence modelling aspects artificial intelligence tool building aspects language features object oriented software development the challenge of coping with complexity methodology and experience software engineering education science policy etc    **New Paradigms for Software Development** William W. Agresti,1986    *User-Developer Cooperation in Software Development* Eamonn O'Neill,2012-12-06 The topic of the research reported here is direct user participation in the task based development of interactive software systems Building usable software demands understanding and supporting users and their tasks Users are a primary source of usability requirements and knowledge since users can be expected to have intimate and extensive knowledge of themselves their tasks and their working environment Task analysis approaches to software development encourage a focus on supporting users and their tasks while participatory design approaches encourage users direct active contributions to software development work However participatory design approaches often concentrate their efforts on design activities rather than on wider system development activities while task analysis approaches generally lack active user participation beyond initial data gathering This research attempts an integration of the strengths of task analysis and user participation within an overall software development process This work also presents detailed empirical and theoretical analyses of what it is for users and developers to cooperate of the nature of user developer interaction in participatory settings Furthermore it makes operational and assesses the effectiveness of user participation in development and the impact of user developer cooperation on the resulting software product The research addressed these issues through the development and application of an approach to task based participatory development in two real world development projects In this integrated approach the respective strengths of task analysis and participatory design methods complemented each other's weaker aspects    *Software Engineering Techniques Applied to Agricultural Systems* Petraq J. Papajorgji, Panos M.
