New Perspectives In Cerebral Localization:

New Perspectives in Cerebral Localization Richard A. Thompson, John R. Green, 1982-01-01 *New perspectives in cerebral localization. Proceedings of a Symposium....sponsored by the Barrow Neurological Institute* Richard A. Thompson, 1982 *Cerebral Cortex* Alan Peters, Edward G. Jones, 2013-11-11 This volume of the series on Cerebral Cortex deals with a variety of topics that need to be considered in our overall understanding of the functions of the cerebral hemispheres. Chapters in the first part of this volume deal with normal functions that were not covered in earlier volumes while chapters in the latter part deal with the functioning of the cortex in various altered states. The first chapter is by Eberhard Fetz, Keisuke Toyama, and Wade Smith, and it considers the interactions that can be demonstrated to exist between cortical neurons by using the technique of cross correlation. The second chapter is by Brent Vogt, who examines the connections and functions of layer I of the cerebral cortex, a layer that has been largely ignored in the past, and he proposes that this layer probably plays an important role in learning and memory acquisition. This is followed by a chapter in which Oswald Steward presents a review of what is currently known about synaptic replacement following denervation of cortical neurons and especially those in the hippocampus.

Neuropsychological Studies of Apraxia and Related Disorders

E.A. Roy, 1985-02-01 Apraxia is a term used to denote a disorder in the performance of limb, verbal, and oral, non-verbal gestures, with often preserved ability to perform these same gestures outside the clinical setting in the appropriate situation or environment. Over the past century and particularly in the past four decades, a great deal of research has focused on understanding the nature of this complex disorder. This book is a review of current approaches to the study of apraxia and related action sequencing disorders, as well as an examination of the mechanisms thought to underlie these disorders. Neuropathological processes associated with apraxia are evaluated and principles of motor control, handedness, and bimanual coordination are considered as they relate to the study of apraxic disorders.

Cerebral Cortex Edward G. Jones, Alan

Peters, 2012-12-06 The cerebral cortex, especially that part customarily designated neocortex, is one of the hallmarks of mammalian evolution and reaches its greatest size relatively speaking, and its widest structural diversity in the human brain. The evolution of this structure is remarkable for the huge numbers of neurons that it contains, as for the range of behaviors that it controls. It has been of abiding interest to many generations of neuroscientists. Yet few theories of cortical evolution have been proposed and none has stood the test of time. In particular, no theory has been successful in bridging the evolutionary gap that appears to exist between the pallium of non-mammalian vertebrates and the neocortex of mammals. Undoubtedly, this stems in large part from the rapid divergence of non-mammalian and mammalian forms and the lack of contemporary species whose telencephalic wall can be seen as having transitional characteristics. The monotreme cortex, for example, is unquestionably mammalian in organization and that of no living reptile comes close to resembling it. Yet, anatomists such as Ramon y Cajal, on examining the finer details of cortical structure, were struck by the similarities in
