**High Resolution NMR Spectroscopy in Solids** M. Mehring, 2012-12-06 Manipulation and Dilution Tools for Ruling Abundant Species NMR is dead was the slogan heard in the late 1960s at least among physicists until John S Waugh and his co workers initiated a series of new NMR experiments which employed the coherent modulation of interactions by strong radiofrequency fields A wealth of new phenomena was observed which are summarized in the introduction for the convenience of the unbiased reader whereas Section 2 collects the basic spin interactions observed in solids Line narrowing effects in dipolar coupled solids by the application of multiple pulse experiments are extensively discussed in Section 3 Numerous extensions of the basic Waugh Huber and Haeberlen experiment have been developed by different groups and have been applied to the nuclei IH 9Be 19F 27Al 31p 63CU in solids Application of this technique to a variety of systems is still in progress and should reveal interesting insights into weak spin interactions in solids It was soon realized that rare spins could be used as monitors for molecular fields in the solid state however rare spin observation is difficult because of the small signal to noise ratio Pines Gibby and Waugh introduced a new concept of cross polarization based on ideas of Hahn and co workers which allows the detection of rare spins with increased sensitivity The dynamics involved are treated in detail Other sections merely list results obtained by the techniques described and demonstrate their usefulness in the investigation of dynamical problems in molecular and solid state physics *Catalog of Copyright Entries. During the last thirty years with the development of high speed electronic computers methods have evolved which permit an accurate and quantitative ab initio determination of the electronic wavefunctions of atoms and molecules. Thus a detailed elucidation of the electronic energy and structure of molecules has become possible using quantum mechanics directly. However it is necessary if such calculations are to yield accurate and reliable results to include electron correlation explicitly which requires in general configuration mixing procedures with an extremely large number of configurations of the order of 10 configurations. With eigenvalue problems of this size the limits of even the largest and fastest computers are reached rapidly and their solution has become possible only because direct methods have been developed which permit the determination of eigenvalues and eigenvectors for such large matrices iteratively without constructing the energy matrix explicitly. These direct methods had been limited to the description of closed shell systems i.e. systems with a single dominant closed shell reference determinant. This limitation arose because with an open shell reference or with several reference determinants no procedures were known which allowed a rapid calculation of the energy matrix elements between configurations with general and widely different spin couplings which would be necessary. Recently such methods have been developed based on early work of Gelfand, Biedenharn and Moshinski using a unitary group representation of different spin coupled states. ## **New Theoretical Aspects Topics In Current Chemistry** Book Review: Unveiling the Magic of Language

In a digital era where connections and knowledge reign supreme, the enchanting power of language has been more apparent than ever. Its ability to stir emotions, provoke thought, and instigate transformation is actually remarkable. This extraordinary book, aptly titled "**New Theoretical Aspects Topics In Current Chemistry**," written by a highly acclaimed author, immerses readers in a captivating exploration of the significance of language and its profound effect on our existence. Throughout this critique, we shall delve into the book's central themes, evaluate its unique writing style, and assess its overall influence on its readership.
